Title: The Day Netflix Discovered a Sneaky DDoS Attack and Helped Protect the Internet

Understanding DDoS Attacks

In June 2016, a Netflix security engineer named Scott Behrens conducted a massive test on the streaming service's infrastructure. With the help of cloud security engineer Jeremy Heffner and other team members, they discovered a unique type of distributed denial of service (DDoS) attack that could potentially harm not just Netflix but the entire internet. Fortunately, they also found ways to prevent it from happening in the future.

First, let's understand what a DDoS attack is. Normally, a DDoS attack floods a website or service with tons of junk traffic requests, overwhelming the system to either crash it completely or slow it down until it can't function normally. However, Netflix is built to handle a massive amount of data during peak hours, so a typical DDoS attack wouldn't have much impact. It would be like trying to fill a giant cave with a small shovel.

A New Type of DDoS Attack

But Behrens came up with a different type of DDoS attack, one that turned Netflix's application programming interface (API) against itself. An API is like a gateway that connects different parts of a computer system, allowing them to communicate with each other. Behrens realized that an attacker could send a small number of resource-intensive requests that would trigger more and more requests, cascading deep into the system. In this way, an attacker could easily and cheaply cause significant resource burden and even take Netflix down.

Testing the Attack with Chaos Kong

To test this attack, Behrens and his team used a "Chaos Kong," a time when Netflix engineers reroute customers away from a certain region of production servers so they can experiment in a real-world environment. This process also helps ensure that Netflix can continue to provide service to its customers even if one of its regions goes down or experiences problems.

The Rarity and Potential Impact of Application DDoS Attacks

Application DDoS attacks like the one Behrens discovered are rare, accounting for less than 1 percent of all DDoS attacks. However, Netflix's application security team works to stay ahead of attackers, so even such a small percentage merited closer examination. Especially since this type of attack requires fewer resources than the more common standard version, meaning it could become more popular among attackers.

Improving Protections Against Sneaky DDoS Attacks

To improve protections against these types of attacks, Behrens suggests more robust monitoring of middle-tier and backend service traffic and behavior. This would give operators more insight into what's going on deep in their systems and help them spot problems early.
