

Solution: Bridges have to build a *spanning tree* because they forward packets according to MAC addresses which are not structured and they do not detect frames that loop. Routers do not have to build a spanning tree since they forward packets according to IP addresses which are structured and eventually discard packets that loop.

2. *What happens to packets if there is a routing loop with bridges? with routers?*

Solution: Packets loop indefinitely if there is a routing loop with bridges. Packets will eventually be discarded if there is a routing loop with routers because of the TTL field.

3. *Is it possible for a link-state algorithm to use the Bellman-Ford algorithm? Why or why not?*

Solution: The link-state algorithm can use the Bellman-Ford algorithm (static version) for computing the shortest path to all other nodes since the Bellman-Ford algorithm requires only a partial view of the network and the link-state algorithm provides a complete topology view of the network.

Exercise 2.3 Consider the network in Figure 1. It represents a small corporate network. The IP addresses are shown explicitly; M1 to M15 mean MAC addresses. B1, B2 and B3 are bridges; R1, R2 and R3 are routers.

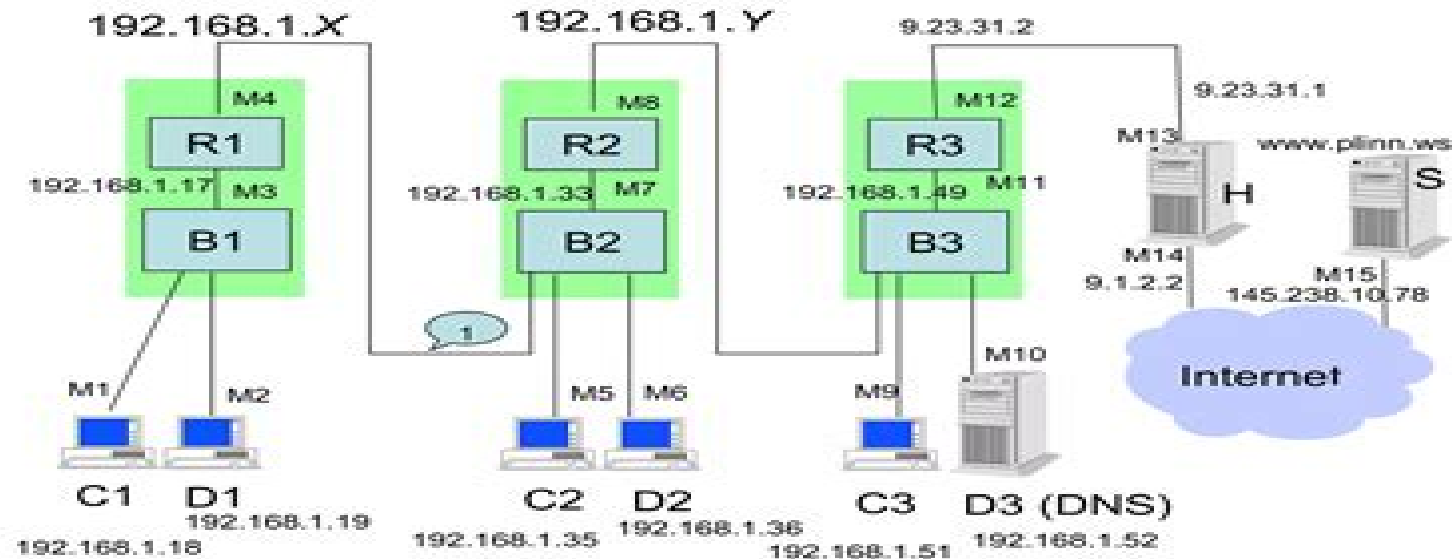

Figure 1: A small corporate network (exercise 2.3).

D3 is the DNS server for this network. The machines C1, D1, C2, D2, and C3 are configured with DNS
