

Experimental Research Designs

Experimental research designs are used to determine the causal relationship between variables. In an experimental design, the researcher manipulates one or more independent variables and measures the effect on the dependent variable. This design allows for the control of extraneous variables, which can confound the results of the study.

Randomized Controlled Trial

A randomized controlled trial (RCT) is a type of experimental design where participants are randomly assigned to either an experimental group or a control group. The experimental group receives the treatment being tested, while the control group receives a placebo or no treatment. This design helps to minimize bias and ensure that any differences in outcomes are due to the treatment.

RCTs are commonly used in medical research to evaluate the effectiveness of new drugs or treatments. They are also used in social sciences to study the impact of interventions on behavior or attitudes.
