Projects Chimay Anumba, John M. Kamara, Anne-Francoise Cutting-Decelle, 2006-09-27 Concurrent Engineering (CE) is a systematic approach to the integrated and concurrent design of products and related processes, which offers considerable potential for increasing efficiency and effectiveness by considering all the elements of a building or structure over its life cycle and including issues of quality, cost, schedule, and user requirements. This book presents latest research on the implementation of Concurrent Engineering in construction projects. **Automatic extraction and processing of**

document references Kathrin Eichler, 2010-10-13 Master's Thesis from the year 2007 in the subject Computer Science Applied, grade 1.0 University of Sunderland School of Computing and Technology, language English, abstract. While reading documents, you often encounter text passages advising you to refer to other documents for more information about a specific topic. These references to other documents are particularly common in technical documents written for the sole purpose of providing the reader with as much relevant information as possible without rephrasing information that can be found elsewhere. Knowing how the documents in a system are interrelated, i.e., which other documents a document refers to or is referred by, can be extremely helpful when trying to get access to relevant information. A typical example of such a knowledge network providing information about document relations is CiteSeer, a digital library of academic literature. For each document in the library system, CiteSeer displays lists of related documents, such as a list of documents that the current document cites as well as a list of documents that the current document is cited by. The assumption that inspired this thesis is that such lists are not only helpful when reading academic literature but could also assist a reader of technical documents stored in a company's document management system. The idea was thus to extend an existing document management system by displaying for each document stored in the system a list of links to documents that the current document refers to. As information about how the documents in this system are interrelated was not available, the focus of the project underlying this thesis was on the first step towards solving this task: automatically analyzing documents in order to extract names of related documents. Once

all document names mentioned in a document have been extracted the next step would then be to search for these documents in the system's database and in case they have been successfully found create links to the respective documents. The outcome of the project was a system that performs the extraction task. It is based on Conditional Random Fields, a machine learning technique introduced by Lafferty et al 2001 and is able to extract document names from unseen documents achieving high precision scores 88% and acceptable recall scores 65% on a test dataset. The implementation is based on a Java package provided by Sarawagi Cohen 2005 which was adapted and extended to suit the nature of the task. As the approach is based on supervised learning the project also involved the generation of appropriate training data.
