Klugman, 1991-11-30 The debate between the proponents of classical and Bayesian statistica methods continues unabated It is not the purpose of the text to resolve those issues but rather to demonstrate that within the realm of actuarial science there are a number of problems that are particularly suited for Bayesian analysis This has been apparent to actuaries for a long time but the lack of adequate computing power and appropriate algorithms had led to the use of various approximations The two greatest advantages to the actuary of the Bayesian approach are that the method is independent of the model and that interval estimates are as easy to obtain as point estimates The former attribute means that once one learns how to analyze one problem the solution to similar but more complex problems will be no more difficult The second one takes on added significance as the actuary of today is expected to provide evidence concerning the quality of any estimates While the examples are all actuarial in nature the methods discussed are applicable to any structured estimation problem In particular statisticians will recognize that the basic credibility problem has the same setting as the random effects model from analysis of variance **Some Recent Researches in the Theory of Statistics and Actuarial Science** J. F. Steffensen, 2016-02-25 Originally published in 1930 this book was formed from the content of three lectures delivered at London University during

Leases for Lives David R. Bellhouse, 2017-07-14 Many historians of insurance have commented on the disconnect between the rise of English life insurance companies in the early eighteenth century and the mathematics behind the sound pricing of life insurance products that was developed at about the same time Insurance and annuity promoters typically ignored this mathematical work Bellhouse explores this issue and shows that the early mathematical work was not motivated by insurance but instead by the fair valuation of life contingent contracts related to property Even the work of the mathematician James Dodson in the creation of the Equitable Life Assurance Society offering sound actuarially based premiums did not change the industry in any significant way The tipping point was a crisis in 1770 in which the philosopher and mathematician Richard Price as well as other mathematicians showed that a dozen or more recently formed annuity societies could not meet their financial obligations and were inviable
