**Active Prototyping** Maroula Bacharidou, 2018 In the wake of an increased accessibility of rapid prototyping tools in design education and practice designers still face a series of challenges related to their use one of them being the way in which they use these machines to actively explore and enhance their ideas At the same time the concepts of continuous interaction with computational fabrication tools and design exploration through physical prototyping are gaining impetus in computational design research and human computer interaction Stimulated by these inquiries the hypothesis of this thesis is that physical prototyping tools can be used as tools for active design exploration and evaluation Towards this goal I introduce Active Prototyping a framework for enhancing physical engagement with design objects by aiding the designer to project the impact of tools on design outcomes and explore a range of possible design solutions while making Active Prototyping integrates the following operations a physical control of a fabrication device b recording of designer actions while using the device c visual exploration of possible design solutions while developing a physical prototype and d machine feedback on the prototyping of selected design solutions To demonstrate the Active Prototyping framework I develop Fabcorder a technical apparatus that implements a number of the above operations Through application examples I demonstrate how Active Prototyping can render physical prototyping processes more exploratory and digital fabrication processes more intuitive I conclude by proposing action recording and generative methods as two novel additions to existing frameworks for computational design and fabrication that can bring future tool making strategies into a more creative context

**Advanced Product Realization Through Model-based Design and Virtual Prototyping**, 1995 Several government agencies and industrial

sectors have recognized the need for and payoff of investing in the methodologies and associated technologies for improving the product realization process. Within the defense community as well as commercial industry there are three major needs. First they must reduce the cost of military products of related manufacturing processes and of the enterprises that have to be maintained. Second they must reduce the time required to realize products while still applying the latest technologies. Finally they must improve the predictability of process attributes, product performance, cost, schedule, and quality. They must continue to advance technology quickly, incorporate their innovations in new products and in processes to produce them, and they need to capitalize on the raw computational power and communications bandwidth that continues to become available at decreasing cost. Sandia National Laboratories initiative is pursuing several interrelated key concepts and technologies in order to enable such product realization process improvements: model based design, intelligent manufacturing processes, rapid virtual and physical prototyping, and agile people enterprises. While progress in each of these areas is necessary, this paper only addresses a portion of the overall initiative. First, a vision of a desired future capability in model based design and virtual prototyping is presented. This is followed by a discussion of two specific activities: parametric design analysis of Synthetic Aperture Radars (SARs) and virtual prototyping of miniaturized high density electronics that exemplify the vision, as well as provide a status report on relevant work in progress.

### **Interactive Prototyping of Interactions**

Germán Leiva, 2018. Prototyping is essential in any design process. During the early stages, designers rely on rapid prototyping to explore ideas. Current rapid prototyping tools and techniques focus on paper representations and their disposability. However, while these throwaway prototypes are quick to create, they are difficult to iterate over. I argue that rapid prototyping tools can effectively support reusable as well as throwaway artifacts for sketching interaction in early stage design. First, I investigate tools in the context of video prototyping. Designers experience two main barriers to use video in interaction design: the time to capture and edit the video artifacts. To aid during the capturing phase of video prototyping, I created VideoClipper. This tool embodies an integrated iterative design method that rewards discipline but permits flexibility for video prototyping. The tool provides a storyboard style overview to organize multiple videos in story lines. VideoClipper offers editable and reusable TitleCards, video capture for steady state and rough stop motion filming, and the ability to recombine videos in new ways for redesign. I present informal user studies with interaction design students using VideoClipper in three design courses. Results suggest that participants spend less time capturing and editing in VideoClipper than with other video tools. However, many designers find tedious to create stop motion videos for continuous interactions and to re-shoot clips as the design evolves. Participants continuously try to reduce re-shooting by reusing backgrounds or mixing different levels of fidelity. Inspired by this behavior, I created Montage, a prototyping tool for video prototyping that lets designers progressively augment paper prototypes with digital sketches, facilitating the creation, reuse, and exploration of dynamic interactions. Montage uses chroma keying to decouple the prototyped interface from its context of use, letting designers reuse or change

them independently I describe how Montage enhances video prototyping by combining video with digital animated sketches encourages the exploration of different contexts of use and supports prototyping of different interaction styles Second I investigate how early designs start being implemented into interactive prototypes Professional designers and developers often struggle when transitioning from the illustration of the design to the actual implementation of the system In collaboration with Nolwenn Maudet I conducted three studies that focused on the design and implementation of custom interactions to understand the mismatches between designers and developers processes tools and representations We find that current practices induce unnecessary rework and cause discrepancies between design and implementation and we identify three recurring types of breakdowns omitting critical details ignoring edge cases and disregarding technical limitations I propose four design principles to create tools that mitigate these problems Provide multiple viewpoints maintain a single source of truth reveal the invisible and support design by enaction We apply these principles to create Enact an interactive live environment for prototyping touch based interactions We introduce two studies to assess Enact and to compare designer developer collaboration with Enact versus current tools Results suggest that Enact helps participants detect more edge cases increases designers participation and provides new opportunities for co creation These three prototyping tools rely on the same underlying theoretical principles reification polymorphism reuse and information substrates Also the presented tools outline a new prototyping approach that I call Takeaway Prototyping In contrast to throwaway prototypes instead of emphasizing disposability tools for Takeaway Prototyping support design by enaction and reify design artifacts to materialize the lessons learned
