Approximation Algorithms Vijay V. Vazirani, 2013-03-14 Most natural optimization problems including those arising in important application areas are NP hard Therefore under the widely believed conjecture that $P \neq NP$ their exact solution is prohibitively time consuming Charting the landscape of approximability of these problems via polynomial time algorithms therefore becomes a compelling subject of scientific inquiry in computer science and mathematics This book presents the theory of approximation algorithms This book is divided into three parts Part I covers combinatorial algorithms for a number of important problems using a wide variety of algorithm design techniques Part II presents linear programming based algorithms These are categorized under two fundamental techniques rounding and the primal dual schema Part III covers four important topics the first is the problem of finding a shortest vector in a lattice the second is the approximability of counting as opposed to optimization problems the third topic is centered around recent breakthrough results establishing hardness of approximation for many key problems and giving new legitimacy to approximation algorithms as a deep theory and the fourth topic consists of the numerous open problems of this young field This book is suitable for use in advanced undergraduate and graduate level courses on approximation algorithms An undergraduate course in algorithms and the theory of NP completeness should suffice as a prerequisite for most of the chapters This book can also be used as supplementary text in basic undergraduate and graduate algorithms courses

Combinatorial Optimization and Graph Algorithms Takuro Fukunaga, Ken-ichi Kawarabayashi, 2017-10-02 Covering network designs discrete convex analysis facility location and clustering problems matching games and parameterized complexity this book discusses theoretical aspects of combinatorial optimization and graph algorithms Contributions are by renowned researchers who attended NII Shonan meetings on this essential topic The collection contained here provides readers with the outcome of the authors research and productive meetings on this dynamic area ranging from computer science and mathematics to operations research Networks are ubiquitous in today's world the Web online social networks and search and query click logs can lead to a graph that consists of vertices and edges Such networks are growing so fast that it is essential to design algorithms to work for these large networks Graph algorithms comprise an area in computer science that works to design efficient algorithms for networks Here one can work on theoretical or practical problems where implementation of an algorithm for large networks is needed In two of the chapters recent results in graph matching games and fixed parameter tractability are surveyed Combinatorial optimization is an intersection of operations research and mathematics especially discrete mathematics which deals with new questions and new problems attempting to find an optimum object from a finite set of objects Most problems in combinatorial optimization are not tractable i.e. NP hard Therefore it is necessary to design an approximation algorithm for them To tackle these problems requires the development and combination of ideas and techniques from diverse mathematical areas including complexity theory algorithm theory and matroids as well as graph
