Key Features: A simple organized chapter layout that focuses on fundamental and practical information about thermal fluid science experiments and equipment. Provides an introduction to essential knowledge for analysis and evaluation of practical systems and major inventions. Presents information about analysis of operating data for power plant efficiency. Detailed chapters for studying and testing wind tunnels, sphere heating, cooling pipe flow engines, and refrigerators, heat pumps are provided. Experimental data of Venturi and orifice plate flow meters are provided to show step by step calibration and experimentation. Presents information on report preparation. Includes multiple appendices to consolidate practical information for readers for quick reference. Audience: Students and teachers in mechanical engineering programs or any courses that have modules on fluid mechanics, heat transfer, and practical thermodynamics.

Graphical Thermodynamics and Ideal Gas Power Cycles Mufid I. Hilal, 2017-07-12 In this book an almost new approach to modern thermodynamics has been applied. One or more useful qualitative discussion statements have been extracted from each equation. These and other important statements were numbered and their titles were situated in an index titled Hilal and Others statements, definitions, and rules. This ensures very quick obtaining of the required statements, rules, definitions, equations, and their theoretical base that will ease readers' qualitative discussions and calculations.

Fundamentals of Aircraft and Rocket Propulsion Ahmed F. El-Sayed, 2016-05-25 This book provides a comprehensive basis to an advanced course in an aero thermal science vital to the design of engines for either type of craft. The text classifies engines powering aircraft and single multi stage rockets and derives performance parameters for both from basic aerodynamics and thermodynamics laws. Each type of engine is analyzed for optimum performance goals and mission appropriate engine selection is explained. Fundamentals of Aircraft and Rocket Propulsion provides information about and analyses of thermodynamic cycles of shaft engines, piston, turboprop, turboshaft, and propfan jet engines, pulsejet, pulse detonation engine, ramjet, scramjet, turbojet, and turbofan, chemical and non chemical rocket engines, conceptual design of modular rocket engines, combustor, nozzle, and turbopumps, and conceptual design of different modules of aero engines in their design and off design state. Aimed at graduate and final year undergraduate students, this textbook provides a thorough grounding in the history and classification of both aircraft and rocket engines, important design features of all the engines, detailed and particular consideration of special aircraft such as unmanned aerial and short vertical takeoff.

and landing aircraft End of chapter exercises make this a valuable student resource and the provision of a downloadable solutions manual will be of further benefit for course instructors
