

Chapter 11 Introduction to Genetics

Section Review 11-1

Reviewing Key Concepts

Short Answer On the lines provided, answer the following questions.

1. State Mendel's principle of dominance.

Mendel's principle of dominance states that some alleles are dominant + others are recessive.

2. Which two combinations of alleles could produce a trait controlled by a dominant allele?

A + trait if there are 2 dominant or 1 dominant + 1 recessive alleles present.

3. What combination of alleles could produce a trait controlled by a recessive allele?

A + trait controlled by a recessive allele will be produced only when 2 recessive alleles are present.

4. Explain segregation of alleles, using pea plant traits in your example.

Segregation is the process during gamete formation in which the two alleles are separated from each other so that each gamete carries only a single copy of each gene.

Reviewing Key Skills

5. Applying Concepts Explain how Mendel's experiments would have been different if he had not worked with true-breeding plants.

True breeding plants allowed Mendel to pinpoint the cause of variation in traits b/c he could control which plants bred. w/o true-breeding plants, Mendel would not have been able to draw his conclusion b/c there would be too many variables.

6. Comparing and Contrasting Explain the difference between cross-pollination and self-pollination in plants.

Cross-pollination is the process of one plant fertilizing another, while self-pollination occurs when a plant fertilizes itself.

7. Calculating One fourth of the plants resulting from a certain cross are expected to show a trait controlled by a recessive allele. If 675 plants resulting from the cross display a trait controlled by a dominant allele, how many plants will show the trait controlled by the recessive allele?

225 plants will show the trait controlled by the recessive allele.

8. Applying Concepts If one of the plants used in the F_1 cross had TT alleles and was combined with a plant with Tt alleles, would the trait controlled by the recessive allele have been produced in the resulting F_2 generation? Explain your answer.

The trait controlled by the recessive allele would not have been produced in the resulting F_2 generation. Both F_1 generation plants need to have Tt allele combinations for the trait controlled by the recessive allele to be produced in one of the F_2 generation plants.

Genetic Diagnosis of Endocrine Disorders Roy E. Weiss, Samuel Refetoff, 2010-06-03 Since the beginning of the current century endocrine disease diagnosis and treatment have moved beyond the standard hormone measurements While indeed elevated thyroid hormone levels or low insulin levels signal a specific endocrine disease correct diagnosis and therefore correct treatment depends on an understanding of the molecular basis for the disease This book presents the bench to bedside approach of our understanding of the genetic basis for endocrine disease It is organized by endocrine grouping e g Thyroid Pancreas Parathyroid Pituitary Adrenal Reproductive and Bone and genetic molecular basis for the diagnosis of the various disorders will be discussed Emphasis will be placed on the practical nature of diagnosing a disease For example 1 Which tests should be done for the diagnosis of Diabetes mellitus Type I in children who presented at less than 6 months at less than 12 years in adulthood etc and why should those tests be done 2 Which genes should be evaluated for subjects with congenital hypothyroidism 3 Which genetic tests should be ordered in obesity 4 Which genetic test should be ordered in a patient with Parathyroid Carcinoma 5 What is the rationale behind testing for Multiple Endocrine Neoplasia The field of genetic diagnosis of disease is exploding now with multiple laboratories developing tests for current clinical use Most practicing endocrinologists pediatricians and internal medicine physicians don't understand which test to order how the tests are done or how to interpret the results One of the most exciting developments in medicine today is the pharmacogenomics revolution endocrinologists and geneticists need to understand how personalized medicine will fit into the daily care of patients While this is a quickly growing area and there are textbooks on pharmacogenomics there is no one source for the spectrum of Endocrine diseases Selected for inclusion in Doody's Core Titles 2013 an essential collection development tool for health sciences libraries Presents a comprehensive translational look at all aspects of genetic diagnosis of endocrine disorders in one reference work Endocrinology experts the researchers who discovered the majority of the gene mutations for a particular disease teach readers about the molecular basis for diseases in each major endocrine organ system Clear presentation by geneticists of pharmacogenetics and the actual assays used in detecting endocrine diseases Genetic counselors offer expert advice on how to use genetic information in counseling patients
