(Class - XI)

Question 1:

Why are living organisms classified?

Answer 1:

A large variety of plants, animals, and microbes are found on earth. All these living organisms differ in size, shape, colour, habitat, and many other characteristics. As there are millions of living organisms on earth, studying each of them is impossible. Therefore, scientists have devised mechanisms to classify all living organisms. These methods of classification are based on rules and principles that allow identification, nomenclature, and finally classification of an organism.

For example, based on certain principles, once an organism is identified as an insect, it will be given a scientific name and then grouped with other similar organisms. Thus, various groups or taxon include organisms based on their similarity and differences.

Therefore, the biological classification helps in revealing the relationship between various organisms. It also helps in making study of organisms easy and organized.

Question 2:

Why are the classification systems changing every now and then?

Answer 2:

Millions of plants, animals, and microorganisms are found on earth. Many of these have been identified by the scientists while many new species are still being discovered around the world. Therefore, to classify these newly discovered species, new systems of classification have to be devised every now and then. This creates the requirement to change the existing systems of classification.

Question 3:

What different criteria would you choose to classify people that you meet often?

Answer 3:

To classify a class of forty students, let us start the classification on the basis of sexes of the students. This classification will result in the formation of two major groups- boys and girls.

Each of these two groups can be further classified on the basis of the names of the students falling in these groups.

Since it is possible that more than one student can have a particular name, these names can be further divided based on the surnames.

Since there is still some chance that more than one student can have the same surname, the final level of classification will be based on the roll numbers of each student.

Question 4:

What do we learn from identification of individuals and populations?

Answer 4:

The knowledge of characteristics of an individual or its entire population helps in the identification of similarities and dissimilarities among the individuals of same kind or between different types of organisms. It helps the scientists to classify organisms in various categories.

Question 5:

Given below is the scientific name of Mango. Identify the correctly written name.

Mangifera Indica

Mangifera indica

Answer 5:

In binomial system of nomenclature, the generic name of a species always starts with a capital letter whereas the specific name starts with a small letter. Therefore, the correct scientific name of Mango is *Mangifera indica*.

A Systems Theoretic Approach to Systems and Synthetic Biology II: Analysis and Design of Cellular Systems Vishwesh V. Kulkarni, Guy-Bart Stan, Karthik Raman, 2014-07-03 The complexity of biological systems has intrigued scientists from many disciplines and has given birth to the highly influential field of systems biology wherein a wide array of mathematical techniques such as flux balance analysis and technology platforms such as next generation sequencing is used to understand elucidate and predict the functions of complex biological systems More recently the field of synthetic biology i e de novo engineering of biological systems has emerged Scientists from various fields are focusing on how to render this engineering process more predictable reliable scalable affordable and easy Systems and control theory is a branch of engineering and applied sciences that rigorously deals with the complexities and uncertainties of interconnected systems with the objective of characterising fundamental systemic properties such as stability robustness communication capacity and other performance metrics Systems and control theory also strives to offer concepts and methods that facilitate the design of systems with rigorous guarantees on these properties Over the last 100 years it has made stellar theoretical and technological contributions in diverse fields such as aerospace telecommunication storage automotive power systems and others Can it have or evolve to have a similar impact in biology The chapters in this book demonstrate that indeed systems and control theoretic concepts and techniques can have a significant impact in systems and synthetic biology Volume II contains chapters contributed by leading researchers in the field of systems and synthetic biology that concern modeling physiological processes and bottom up constructions of scalable biological systems The modeling problems include characterisation and synthesis of memory understanding how homoeostasis is maintained in the face of shocks and relatively gradual perturbations understanding the functioning and robustness of biological clocks such as those at the core of circadian rhythms and understanding how the cell cycles can be regulated among others Some of the bottom up construction problems investigated in Volume II are as follows How should biomacromolecules platforms and scalable architectures be chosen and synthesised in order to build programmable de novo biological systems What are the types of constrained optimisation problems encountered in this process and how can these be solved efficiently As the eminent computer scientist Donald Knuth put it biology easily has 500 years of exciting problems to work on This edited book presents but a small fraction of those for the benefit of 1 systems and control theorists interested in molecular and cellular biology and 2 biologists interested in rigorous modelling analysis and control of biological systems
