

Triploblastic Acoelomates & Annelida Review

A passage about the topic: This worksheet reviews major invertebrate groups with a focus on triploblastic acoelomates (like flatworms and roundworms) and the segmented worms known as annelids. Triploblastic animals have three embryonic layers—endoderm, ectoderm, and mesoderm. Some, like Platyhelminthes (flatworms), lack a true body cavity and are called acoelomates. Others, like nematodes and rotifers, have a pseudocoelom, a partial body cavity. Annelids, such as earthworms and leeches, have a true coelom and show metamerism (body segmentation), which helps with movement and specialization. Understanding their structure, reproduction, and adaptations helps explain their evolutionary success.
