*Stochastic Processes for Water Scientists* Robin T. Clarke, 1998-10-15 The discipline of Stochastic Processes is usually treated as a branch of mathematics and there are plenty of books for mathematicians on the subject Equally there are very many books both for statisticians and environmental scientists on Time Series Analysis analysing the structure of data sequences where measurements are made at equal time intervals and are free from intermittent behaviour But this book deals with the analysis of events which occur intermittently in time and space through a very wide range of examples drawn from many areas of environmental science in which the role of water is central the book shows how the same analytical procedures can be applied to very many different problems The book's many examples include analysis of time intervals between El Niño events frequency of dry spells the relation between heavy rainfall and flooding occurrences of gravel disturbance in upland trout streams which damages trout spawn deposits and the cellular structure of rainfall The book does not aim to be an exhaustive treatment of all possible applications of stochastic process models in the environmental sciences but should be regarded as a source book Its aim is to encourage students and research workers to see how environmental problems can be put into a probabilistic framework and to draw their attention to analogous problems and solutions in other fields of environmental science in which water and the transport of material by water is an essential characteristic

**Elements of Distribution Theory** Thomas A. Severini, 2005-08-08 This detailed introduction to distribution theory uses no measure theory making it suitable for students in statistics and econometrics as well as for researchers who use statistical methods Good backgrounds in calculus and linear algebra are important and a course in elementary mathematical analysis is useful but not required An appendix gives a detailed summary of the mathematical definitions and results that are used in the book Topics covered range from the basic distribution and density functions expectation conditioning characteristic functions cumulants convergence in distribution and the central limit theorem to more advanced concepts such as exchangeability models with a group structure asymptotic approximations to integrals orthogonal polynomials and saddlepoint approximations The emphasis is on topics useful in understanding statistical methodology thus parametric statistical models

and the distribution theory associated with the normal distribution are covered comprehensively Characterization Problems in Mathematical Statistics Abram Meerovich Kagan, I.
