Chapter 1

Problem 1.1

A nucleus, originally at rest, decays radioactively by emitting an electron of momentum $1.73 \text{ MeV}/c$, and at right angles to the direction of the electron a neutrino with momentum $1.00 \text{ MeV}/c$. (The MeV (million electron volt) is a unit of energy, used in modern physics, equal to $1.60 \times 10^{-6} \text{ erg}$. Correspondingly, MeV/c is a unit of linear momentum equal to $5.34 \times 10^{-17} \text{ gm-cm/sec.}$) In what direction does the nucleus recoil? What is its momentum in MeV/c ? If the mass of the residual nucleus is $3.90 \times 10^{-27} \text{ gm}$, what is its kinetic energy, in electron volts?

Place the nucleus at the origin, and suppose the electron is emitted in the positive y direction, and the neutrino in the positive x direction. Then the resultant of the electron and neutrino momenta has magnitude

$$|\mathbf{p}_{e+\nu}| = \sqrt{(1.73)^2 + 1^2} = 2 \text{ MeV}/c,$$

and its direction makes an angle

$$\theta = \tan^{-1} \frac{1.73}{1} = 60^\circ$$

with the x axis. The nucleus must acquire a momentum of equal magnitude and directed in the opposite direction. The kinetic energy of the nucleus is

$$T = \frac{p^2}{2m} = \frac{4 \text{ MeV}^2 c^{-2}}{2 \cdot 3.9 \cdot 10^{-27} \text{ gm}} \cdot \frac{1.78 \cdot 10^{-27} \text{ gm}}{1 \text{ MeV} c^{-2}} = 9.1 \text{ ev}$$

This is much smaller than the nucleus rest energy of several hundred GeV , so the non-relativistic approximation is justified.

Classical Mechanics Goldstein Solution:

Classical Analogies in the Solution of Quantum Many-Body Problems Aydın Cem Keser, 2018-11-07 This book addresses problems in three main developments in modern condensed matter physics namely topological superconductivity many body localization and strongly interacting condensates superfluids by employing fruitful analogies from classical mechanics This strategy has led to tangible results firstly in superconducting nanowires the density of states a smoking gun for the long sought Majorana zero mode is calculated effortlessly by mapping the problem to a textbook level classical point particle problem Secondly in localization theory even the simplest toy models that exhibit many body localization are mathematically cumbersome and results rely on simulations that are limited by computational power In this book an alternative viewpoint is developed by describing many body localization in terms of quantum rotors that have incommensurate rotation frequencies an exactly solvable system Finally the fluctuations in a strongly interacting Bose condensate and superfluid a notoriously difficult system to analyze from first principles are shown to mimic stochastic fluctuations of space time due to quantum fields This analogy not only allows for the computation of physical properties of the fluctuations in an elegant way it sheds light on the nature of space time The book will be a valuable contribution for its unifying style that illuminates conceptually challenging developments in condensed matter physics and its use of elegant mathematical models in addition to producing new and concrete results

Hamiltonian Perturbation Solutions for Spacecraft Orbit Prediction Martín Lara, 2021-05-10 Analytical solutions to the orbital motion of celestial objects have been nowadays mostly replaced by numerical solutions but they are still irreplaceable whenever speed is to be preferred to accuracy or to simplify a dynamical model In this book the most common orbital perturbations problems are discussed according to the Lie transforms method which is the de facto standard in analytical orbital motion calculations Due to an oversight an error slipped in Section 4.1 of the book where it is implicitly assumed the case of the Kepler problem The following text should replace Sections 4.1 and 4.2 of the book Cross references may be affected with the new writing In particular former crossed references to Eq 4.3 should now point to current Eq 4.12 Please find the Erratum below

Introduction To Quantum Mechanics: Solutions To Problems John Dirk Walecka, 2021-08-05 The author has published two texts on classical physics Introduction to Classical Mechanics and Introduction to Electricity and Magnetism both meant for initial one quarter physics courses The latter is based on a course taught at Stanford several years ago with over 400 students enrolled These lectures aimed at the very best students assume a good concurrent course in calculus they are otherwise self contained Both texts contain an extensive set of accessible problems that enhances and extends the coverage As an aid to teaching and learning the solutions to these problems have now been published in additional texts A third published text completes the first year introduction to physics with a set of lectures on Introduction to Quantum Mechanics the very successful theory of the microscopic world The Schrödinger equation is motivated and presented Several

applications are explored including scattering and transition rates The applications are extended to include quantum electrodynamics and quantum statistics There is a discussion of quantum measurements The lectures then arrive at a formal presentation of quantum theory together with a summary of its postulates A concluding chapter provides a brief introduction to relativistic quantum mechanics An extensive set of accessible problems again enhances and extends the coverage The current book provides the solutions to those problems The goal of these three texts is to provide students and teachers alike with a good understandable introduction to the fundamentals of classical and quantum physics
