Frederick Barker, 1873 **Matter and Energy**, 2005 Space, Geometry, and Kant's Transcendental Deduction of the
Categories Thomas C. Vinci, 2015 Thomas C Vinci aims to reveal and assess the structure of Kant's argument in the Critique
of Pure Reason called the Transcendental Deduction of the Categories At the end of the first part of the Deduction in the B
edition Kant states that his purpose is achieved to show that all intuitions in general are subject to the categories On the
standard reading this means that all of our mental representations including those originating in sense experience are
structured by conceptualization But this reading encounters an exegetical problem Kant states in the second part of the
Deduction that a major part of what remains to be shown is that empirical intuitions are subject to the categories How can
this be if it has already been shown that intuitions in general are subject to the categories Vinci calls this the Triviality
Problem and he argues that solving it requires denying the standard reading In its place he proposes that intuitions in
general and empirical intuitions constitute disjoint classes and that while all intuitions for Kant are unified there are two
kinds of unification logical unification vs aesthetic unification Only the former is due to the categories A second major theme
of the book is that Kant's Idealism comes in two versions for laws of nature and for objects of empirical intuition and that
demonstrating these versions is the ultimate goal of the Deduction of the Categories and the similarly structured Deduction
of the Concepts of Space respectively Vinci shows that the Deductions have the argument structure of an inference to the

concerns involved in its production and developing technologies Coal accounts for approximately one quarter of world energy
consumption Of the coal produced worldwide approximately 65% is shipped to electricity producers and 33% to industrial
consumers and most of the remainder goes to consumers in the residential and commercial sectors The total share of total
world energy consumption by coal is expected to increase to almost 30% in 2035 This handbook describes the challenges and
steps by which electricity is produced from coal and deals with the challenges for removing the environmental objections to
the use of coal in future power plants New technologies are described that could virtually eliminate the sulfur nitrogen and
mercury pollutants that are released when coal is burned for electricity generation In addition technologies for the capture of
greenhouse gases emitted from coal fired power plants are described and the means of preventing such emissions from
