Minimax Robustness in Signal Processing for Communications Muhammad Danish Nisar, 2011-08-01 Abstract From a signal processing for communications perspective three fundamental transceiver design components are the channel precoder the channel estimator and the channel equalizer The optimal design of these blocks is typically formulated as an optimization problem with a certain objective function and a given constraint set However besides the objective function and the constraint set their optimal design crucially depends upon the adopted system model and the assumed system state While optimization under a perfect knowledge of these underlying parameters system model and state is relatively straight forward and well explored the optimization under their imperfect partial or uncertain knowledge is more involved and cumbersome Intuitively the central question that arises here is should we fully trust the available imperfect knowledge of the underlying parameters should we just ignore it or should we go for an intermediate approach This thesis deals with three crucial transceiver design problems from a signal processing for communications perspective and attempts to answer the fundamental question of how

to handle the presence of uncertainty about the design parameters in the respective optimization problem formulations
