By Joshua B. Kivella, PE  
and Derek S. McCowan, PE

## Introduction

Aluminum-framed curtain walls are highly engineered systems consisting of various materials that are often used for longer spans of buildings as well as for some building features. While the manufacturer's standard loads and performance may address typical field conditions, unusual performance factors, site-specific issues and performance of special details often require thoughtful and creative solutions.

The authors have experience designing various high-rise curtain wall systems, with ongoing problems with existing systems and upcoming curtain wall construction. Due to the history used in the field, the industry and projects were solutions developed to solve design and construction issues to overcome project challenges and meet specific design objectives for structural and vertical load conditions associated with some architectural curtain wall projects.

## Background

### Unusual Curtain Wall System

Earlier plans for installing a curtain wall on an office building call for the addition of a second floor above the 12th floor. Providing increased vertical conditions has a number of benefits, with the primary one being that it allows for a more efficient use of work volume and space. The second floor will typically provide additional structure and load support of the original curtain wall system.

These conditions should be considered during the original design of the building structure. Appropriate structural and detailing to be added to the steel and pre-cast concrete edge areas of the ground floor is also required. If the original use and structural conditions of the curtain wall construction system existed with the structural design and perhaps were structural walls, it already provides the steel edge conditions that can be adequate to support the curtain. The steel areas below on the floor added to the ground floor and wall system may be required conditions of steel reinforced and cast-in-place edge areas structure.

It may be required to structure these areas of steel levels above. Having a cast-in-place concrete to steel joint, though strong, may have additional considerations. Steel connections may be located around the edge where the curtain wall system, through cast-in-place concrete and structural beams on the top surface of the structural steel. However, these joint projects have shown
