Bionic Optimization in Structural Design Rolf Steinbuch, Simon Gekeler, 2015-11-04 The book provides suggestions on how to start using bionic optimization methods including pseudo code examples of each of the important approaches and outlines of how to improve them The most efficient methods for accelerating the studies are discussed These include the selection of size and generations of a study s parameters modification of these driving parameters switching to gradient methods when approaching local maxima and the use of parallel working hardware Bionic Optimization means finding the best solution to a problem using methods found in nature As Evolutionary Strategies and Particle Swarm Optimization seem to be the most important methods for structural optimization we primarily focus on them Other methods such as neural nets or ant colonies are more suited to control or process studies so their basic ideas are outlined in order to motivate readers to start using them A set of sample applications shows how Bionic Optimization works in practice From academic studies on simple frames made of rods to earthquake resistant buildings readers follow the lessons learned difficulties encountered and effective strategies for overcoming them For the problem of tuned mass dampers which play an important role in dynamic control changing the goal and restrictions paves the way for Multi Objective Optimization As most structural designers today use commercial software such as FE Codes or CAE systems with integrated simulation modules ways of integrating Bionic Optimization into these software packages are outlined and examples of typical systems and typical optimization approaches are presented The closing section focuses on an overview and outlook on reliable and robust as well as on Multi Objective Optimization including discussions of current and upcoming research topics in the field concerning a unified theory for handling stochastic design processes

New Techniques for Modeling, Prognosis,

Diagnosis, and Treatment of Human Knee Pathology Abdelwahed Barkaoui, Bernardo Innocenti ,João Manuel R. S. Tavares,2025-01-06 The knee joint is one of the largest and most powerful joints of the human body since it supports enormous loads and pressures while offering stable and flexible movements For this reason the lower limb is vulnerable to the appearance of degenerative diseases such as femoro tibial osteoarthritis OA that dramatically reduces the quality of life in a patient Knee osteoarthritis represents an enormous public health problem for patients and imposes a significant economic burden Knee OA leads to annual healthcare expenses of more than 27 billion with gross knee arthroplasty budgets reaching 11 billion annually Developing new prognostic technology and methodology could contribute to the detection of this disease and reduce human and economic losses The objective of this research topic is to collect recent studies on the development of new techniques for the prognosis prediction diagnosis and modeling of human knee diseases in particular osteoarthritis The change of biomechanics induced by a knee arthroplasty and its effect on knee performance is also part of the research project proposal
