

ELECTRONIC DICE

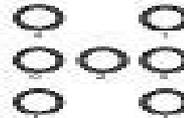

What is a microcontroller?

A microcontroller is often described as a 'computer-on-a-chip'. It can be used as an 'electronic brain' to control a product, toy or machine.

The microcontroller is an integrated circuit ("chip") that contains memory (to store the program), a processor (to process and carry out the program) and input/output pins (to connect switches, sensors and output devices like motors).

Microcontrollers are purchased 'blank' and then programmed with a specific control program. This program is written on a computer and then 'downloaded' into the microcontroller chip. Once programmed the microcontroller is built into a product to make the product more intelligent and easier to use.

Example use of a micro-controller.

The picture above shows an electronic dice that can be made to generate a random number. It can be used like a normal dice in games.

The dice works by switching Light Emitting Diodes (LEDs) on and off in the pattern of dots found on a traditional dice. The microcontroller is the 'brain' of the dice. Microcontrollers are powerful electronic components that have a memory and can be programmed to switch things on and off in any sequence. The microcontroller in the dice can switch the LEDs on and off to show numbers between one and six.

As the 'diagonal' pairs on LEDs in the dice always light at the same time, they can be switched on and off by the same microcontroller output. Therefore 4 outputs (3 pairs and the central 'dot') are required.
