MATLAB Implementation of the Steganographic Algorithm F5 Wassim Al Chamaa, 2019-05-07 Project Report from the year 2018 in the subject Computer Science Programming language English abstract The F5 algorithm proposed by Westfield is still one of the most known algorithms in the field of DCT based steganography It can make a JPEG image a container of a secret message where no one knows the presence of the message except the sender and the intended receiver In this programming work we show how to realize the F5 algorithm via Matlab We present the block diagrams of embedding and extracting processes and the entire Matlab code of the F5 algorithm

Some Notes about the F5 Matlab code

- 1 The implementation code works according to the method proposed by Andreas Westfield in his paper F5 A Steganographic Algorithm High Capacity Despite Better Steganalysis Huffman coding and decoding are implemented using the Matlab JPEG Toolbox developed by Phil Sallee
- 2 The two part Matlab code included in the report embedding and extracting parts can be executed in Matlab IDE The embedding part reads the cover JPEG file and the message file we want to hide then it creates a Stego JPEG file according to the F5 algorithm On the other side The extracting part reads the Stego JPEG file and then it extracts the hidden message file
- 3 The F5 code calls the main two functions of Phil Sallee s Matlab Toolbox JPEG reading and writing These functions make it easier to access and manipulate the quantized DCT coefficients of a given JPEG file Using Sallee s Toolbox should accord with the used operating system whether it is 32 or 64 bits
- 4 The F5 code contains the function to form the image matrix to show the input and output images Running this function requires ALL the Sallee s Toolbox to be installed Otherwise the user can REMOVE this function from the code since it doesn t affect the main F5 process and thus keep ONLY using the main two function of the Sallee s Toolbox
- 5 The message file we want to hide can be any file of any kind and whatever its extension The size of the message file should be appropriate for the size of the used cover JPEG image so no errors will occur when

executed

MATLAB and Simulink Code Generation

F Marquez, 2019-04-07

Generating code from MATLAB algorithms for desktop and embedded systems allows you to perform your software design implementation and testing completely within the MATLAB workspace. You can verify that your algorithms are suitable for code generation. Generate efficient, readable, and compact C/C++ code automatically, which eliminates the need to manually translate your MATLAB algorithms and minimizes the risk of introducing errors in the code. Modify your design in MATLAB code to take into account the specific requirements of desktop and embedded applications, such as data type management, memory use, and speed. Test the generated code and easily verify that your modified algorithms are functionally equivalent to your original MATLAB algorithms. Generate MEX functions to accelerate MATLAB algorithms in certain applications. Speed up fixed-point MATLAB code. Generate hardware description language (HDL) from MATLAB code. To generate C/C++ or MEX code from MATLAB algorithms, you must install the following software: MATLAB Coder product, C/C++ compiler. When writing MATLAB code that you want to convert into efficient standalone C/C++ code, you must consider the following:

- Data types: C and C++ use static typing. To determine the types of your variables before use, MATLAB Coder requires a complete assignment to each variable.
- Array sizing: Variable-size arrays and matrices are supported for code generation. You can define inputs, outputs, and local variables in MATLAB functions to represent data that varies in size at run time.
- Memory: You can choose whether the generated code uses static or dynamic memory allocation. With dynamic memory allocation, you potentially use less memory at the expense of time to manage the memory. With static memory, you get better speed but with higher memory usage. Most MATLAB code takes advantage of the dynamic sizing features in MATLAB; therefore, dynamic memory allocation typically enables you to generate code from existing MATLAB code without modifying it much. Dynamic memory allocation also allows some programs to compile even when upper bounds cannot be found. Static allocation reduces the memory footprint of the generated code and therefore is suitable for applications where there is a limited amount of available memory, such as embedded applications.
