Energy Conservation Update, 1981 The Hierarchy of Energy in Architecture Ravi Srinivasan, Kiel Moe, 2015-06-12

The laws of thermodynamics and their implications for architecture have not been fully integrated into architectural design. Architecture and building science too often remain constrained by linear concepts and methodologies regarding energy that occlude significant quantities and qualities of energy. The Hierarchy of Energy in Architecture addresses this situation by providing a clear overview of what energy is and what architects can do with it. Building on the energy method pioneered by systems ecologist Howard T. Odum, the authors situate the energy practices of architecture within the hierarchies of energy and the thermodynamics of the large non-equilibrium non-linear energy systems that drive buildings, cities, the planet, and universe. Part of the PocketArchitecture series, the book is divided into a fundamentals section which introduces key topics and the energy methodology and an applications section which features case studies applying energy to various architectural systems. The book provides a concise but rigorous exposure to the system boundaries of the energy systems related to buildings and as such will appeal to professional architects and architecture students.

Handbook of Systems Engineering and Analysis of Electro-Optical and Infrared Systems William Wolfgang Arrasmith, 2025-06-30. There has been a lot of innovation in systems engineering and some fundamental advances in the field of optics, imaging, lasers, and photonics that warrant attention. This volume focuses on applications, tools, and techniques of systems engineering related topics from government, industrial, and academic settings such as development and operations, DevOps, agile methods, and the concept of the digital twin. Handbook of Systems Engineering and Analysis of Electro-Optical and Infrared Systems: Applications, Tools, and Techniques offers more information on the application of decision and risk analysis and statistical methods in systems engineering such as design of experiments, DOX methods including statistical process control, hypothesis testing, analysis of variance, blocking, 2k factorial analysis, and regression analysis. It includes new material using model-based systems engineering and systems architecture methods in a system-level design application. The integration of recent high-speed atmospheric turbulence research results in the optical technical examples and case studies to illustrate the new developments is also included. A presentation of new optical technical materials for adaptive optics (AO) and atmospheric turbulence compensation (ATC) systems that are based on illumination from passive sources (natural light) or active sources (coherent light like from lasers) provides the technical focus for the systems engineering methods and techniques. Chapter 13 focuses on the technical aspects of the design process and uses the systems-level design as an illustration. In addition to covering lifecycle cost estimation methods and applying them to an integrated case study that is used to illustrate important concepts and techniques throughout this work, the final section brings everything together in terms of technical cost and schedule performance. Because this volume blends modern-day systems engineering methods with detailed optical systems analysis and applies these methodologies to EO/IR systems, this new edition is an excellent text for professionals in STEM.
