

BIRD BEAK

adaptations

BIRD BEAKS Name: _____

Adaptations are body parts that help a species survive in their environment. Each of the three species described below live in a different environment, which means that they will each have different ways that help them. Read about each of the birds to learn about how their beaks are adapted for their habitats.

Woodpecker
Woodpeckers forage (search) for small bugs in the water. They eat many insects, flies, and worms. Sometimes they also eat small fish. They capture these creatures by conforming to something hidden in the water with their beaks. Unlike anything else, they come from inside to outside, they have a slightly open to capture any prey. Sometimes woodpeckers may also come at the water or even change their heads under water to grab prey that is deeper below the surface.

Kingfisher
Kingfishers are carnivorous birds whose diet consists mostly of fish. Sometimes they swim and other birds. To capture their prey, kingfishers swoop down from the sky and grab the unsuspecting fish or bird with their beaks (the sharp edges on their beak). When it's time to eat, the kingfisher then goes with one of its beaks and rips the fish off the hook with one.

BIRD BEAKS Name: _____

Summarize your findings about each bird and its beak.

Bird Species	Food (What do they eat?)	Beak (What do they use it for?)
Sparrow		
Toucan		
Woodpecker		
King		
Cyanocephalus		

Flamingo
Flamingos diet consists of algae, insects, and small fish. The shape of a flamingo's beak determines what it can eat. The long, downward-curved beak will feed flamingos on an algae-rich diet and insects and small fish. The long, downward-curved beak allows flamingos to filter water through that will get to the bottom of the water to their prey.

Hummingbird
Hummingbirds eat a lot of insects, grass, and nectar. They have a long, thin beak that allows them to reach into flowers to get nectar. Nectar is a flower's sweet liquid substance that is used for energy.

BIRD BEAKS Name: _____

Pelican
Pelicans have mostly on fish. To catch their prey, pelicans swoop down on a school of fish from above. Their long, pointed beaks are used to pierce the fish. Returning to the air, the pelican will shake the lower part of their beak before swallowing the fish.

Sparrow
Sparrows primarily eat small seeds and insects. These birds forage for insects for their prey by feeding on the ground. Sparrows are not concerned to see or smell or taste anything, and they will often take advantage of a bird feeder where it is common.

Toucan
The toucan is a bird that primarily feeds on fruit. These birds have long beaks that are used to pick up fruit from trees. Their beak is long enough to reach fruit on branches that wouldn't support the full weight of their body, and it has rounded edges that help to avoid fruit. It's thought that the toucan's large beak may also play a role in courtship or both sexes.

Woodpecker
The woodpecker's beak is strong and the enough to enable it to be used for drilling holes in wood. In order to protect the soft tissue, a thick, springy skin has developed to absorb the impact of the repeated blows. The woodpecker also has a long, sticky tongue that can be used to catch insects from the holes they have drilled.

King
The king is an omnivorous bird who eats insects such as grasshoppers and worms. They have also been known to eat fish, eggs, eggs, and other small birds. The king primarily uses its long beak to probe into the soil or that for insects such as earthworms.

Cyanocephalus
Cyanocephalus feed almost solely on algae, insects, and spiders. To catch their prey, cyanocephalus will swoop through water with, looking for one with an open shell. When they spot one, the bird uses their beak to pierce and use it to enter the muscle that contains the shell. Some varieties of cyanocephalus also smash the shell open before enjoying the inside.
