**Genome Size and Genetic Homogeneity of Regenerated Plants: Methods and Applications** A. Mujib, 2023-09-13 This reference is a timely compilation of studies of genome size and genetic stability of regenerated plants. It presents 13 book chapters that cover recent advancements in CRISPR Cas based genome editing, the use of molecular markers to analyze somaclonal variation in tissue culture and genetic stability assessment in various plant species including medicinally valuable plants like Valeriana and Coffea. The book also highlights the role of flow cytometry in investigating polyploidy and provides valuable insights into genetic fidelity assessment of micropropagated woody plants and orchids. The contributors have shed light on the intra specific and inter specific genome and chromosome number variation with reference to gene duplication and DNA sequence loss. Molecular techniques for detecting ploidy levels and genetic homogeneity in regenerated plantlets are also discussed. Additional highlights of the book include brief guidelines for experimental protocols for flow cytometry and molecular markers coverage of a wide range of plants and supporting references. This is an excellent reference for biologists, geneticists and plant scientists exploring genetic homogeneity and genome size variation in diverse plant groups.

Tissue culture as a plant production system for horticultural crops Richard H. Zimmerman, Robert J. Griesbach, Freddi A. Hammerschlag, R.H. Lawson, 2012-12-06 In 1980 a conference on tissue culture of fruit crops was held at Beltsville to summarize the current status of this technology and to stimulate interest in it among research scientists, students and commercial producers in the U S. Interest in that conference and the proceedings from it far exceeded the expectations of the organizing committee. Since that time micropropagation of fruit crops in the U S has increased significantly but still lags far behind applications to production of ornamental plants. Within the past two years a number of new laboratories have been established and some of the existing laboratories have expanded to a size far larger than any previously anticipated. Creation of new laboratories capable of producing more than 400 000 plants per week will test the ingenuity of laboratory managers and the skills of marketing departments. In recent years numerous symposia have been held on various aspects of biotechnology and genetic engineering. Although micro propagation is the key to providing large numbers of genetically engineered plants it is a topic that has been relegated to a minor position or ignored completely at such meetings. Accordingly the time seemed propitious for a conference devoted solely to all aspects of micropropagation as applicable to horticultural crops.

Micropropagation of Orchid Esmeralda Clarkei Mukti Ram Paudel, Bijaya Pant, 2012-08 The study of in vitro micropropagation has assumed enormous importance with the tremendous pace of progress in different disciplines of biological sciences. The tissue culture will play an important role in solving the problems of conventional methods for propagation, hybridization, embryo rescue, production of secondary metabolites, production of virus
