P. Sajjan,2019 In today s technological era majority of the human activities are replaced with sensors and actuators and so for the irrigation process in the agricultural field The major part of the automated irrigation system is finding the moisture content of the soil The moisture content in soil is very vital parameter for the growth plant The cost and complexity of the soil moisture sensor may hinder its usage for irrigation The main aim of this article is to present a cost effective and simple moisture sensor Thus the paper describes the detailed analysis of a volume based soil moisture sensor The probes used for sensing are made of iron with an alloy coating which is an anti corrosive and robust material for sensing the moisture content in the field The comprehensive analysis was carried out with large number of test cases and validated against the standard available sensors The compromising results and the simplicity of the said sensor may accelerate its usage for automating the irrigation [Soil Moisture Sensor](#) Deepak Lakshmanan,2005 **Soil Moisture Sensor Evaluation** David L. The Development of a Dielectric Based Soil Moisture Sensor Gregory James Arnold, 1992 *The Design of an Integrated Soil Moisture Sensor for Agriculture* Peter Morris St. Clair Johnson, 2007 Abstract This thesis details the design and testing of several soil moisture sensors for use in agricultural applications The thesis concentrates on capacitive sensors measuring water content by the change in capacitance of two electrodes in direct contact with the soil water although several other sensor types are investigated Two electrodes placed in the soil will have a characteristic complex impedance that depends on the sensor configuration soil structure and soil components The impedance measured is dependant also on the frequency of the signal used for the measurement As the frequency is lowered the effect due to capacitance and inductance become quite small and the impedance becomes mainly resistive Conversely at high frequencies 100MHz the resistive component becomes less significant A sensor designed to operate at 10kHz needs to sense small changes in an already small capacitance pF while ignoring the very significant resistive component The use of insulated electrodes allows the separation of resistive and capacitive components but at the expense of placing a capacitance in series with the small soil capacitance A method was developed to compensate for variations due to manufacturing tolerances in the insulating layer which would have made this solution impractical Reference electrodes constructed on the same substrate as the sensor electrodes correct errors introduced by environmental and manufacturing effects on the electrode insulation A model is presented describing the relation between water content and measured capacitance and conductivity In experimental tests the model is successful in describing some damp to wet soils It is shown that the small soil capacitance due to the water content is swamped by conduction in the soil This would seem to prevent practical water content measurement at low frequencies Experimental work demonstrated that in an insulated electrode sensor operating at low frequencies quite large variations in measured capacitance still occur with changes in water content Soil water forms conductive paths terminating on the electrode insulation surface This capacitance is shown to be unaffected by soil conductivity and varies with water content and so can be used to estimate soil water An insulated electrode sensor incorporating reference electrodes and operating at 10KHz was designed and tested It was shown that the reference electrodes enabled correction of manufacturing and environmental variables It is further demonstrated that contamination of the insulation coating with conductive material from within the soil prevents the practical use of this design A method is shown for deriving both soil water content and water conductivity by measurement of the complex impedance of the sensor in soil Solder less construction of sensor circuitry and electronics using screen printed circuitry on plastic films was demonstrated A design for a sensor using un insulated electrodes and

operating at 10MHz was constructed and tested This sensor was not affected by contamination of the sensor surface
