SKM, ETAP, and EDSA Power System Analysis Tutorials Stephen Philip Tubbs, 2009-05 The object of this book is to teach the beginner the basics of three popular power system analysis programs These programs are designed to simulate and analyze electrical power generation and distribution systems in normal operation and in short circuit The programs also have many add on options like protection selection arc flash analysis transmission line sag tension raceway calculations transient motor starting etc The programs have Demo demonstration or trial versions to allow people to tryout and learn about them This book provides the engineer and technologist with information needed to use the Demo versions of SKM ETAP and EDSA for load flow and short circuit analysis The beginner learns how to use them on a small but realistic three phase power system The information gained is similar to that which students pay for in company taught Introduction to courses However with this book the student avoids paying tuition learns at times of his own convenience and can compare the different programs In this book load flow power flow and short circuit analyses are done on a small steady state three phase power system with manual methods Then each program is used to carry out the same analyses Since in practice three phase systems are the most often analyzed only three phase systems will be considered in this book The DC and single phase capabilities of the programs will not be considered The person using this book should already have an analytical electrical background Academically he should be educated to at least the level of a university two year electrical engineering technology program

Arc Flash Analysis Daniel R. Potton, University of North Carolina at Charlotte. Department of Electrical and Computer Engineering, 2011 Electrical workers are exposed to arc flash hazards that require equipment be de energized during maintenance periods This contributes to a significant loss of system functionality resulting in costly outages Industry standards and health and safety regulations require the implementation of arc flash analyses on electrical equipment however the standards are often equivocal in terminology and difficult to determine when to appropriately apply Arc flash analyses require the use of various parameters combined in complex calculations These exhaustive procedures

make it nearly impossible to perform an accurate arc flash assessment in the field Qualified field personnel need to understand the contributing factors of an arc flash and available retrofit methods for reducing the associated incident energy This thesis investigates the underlying concepts of an arc flash and presents a concise method for performing the analysis on a desired system using the Cooper Bussmann Short Circuit Point to Point method as well as the IEEE 1584 standard An electrical system representative of a small industrial plant is modeled and simulated using Operation Technology Incorporated s ETAP Electrical Transient Analysis Program software To aid in the reduction of an arc flash s total incident energy several sensitive arc flash parameters are defined and with the use of Matlab modeled and examined with the intention of allowing field personnel to quickly and safely recognize methods for arc flash mitigation This thesis can inform field personnel entry level engineers and engineering students of the concepts and sensitive parameters associated with arc flash analyses
