Electrical Engineering Fundamentals II Thomas Talavage,2019-08-06 As the name implies this course is designed to provide a Fundamental approach to Electrical Engineering following the Fundamentals I course We begin our journey with some basic circuit elements and develop a mathematically motivated approach to linear circuit analysis using Ordinary Differential Equations ODEs to discover Convolution Laplace Transforms Transfer Functions and Frequency Filtering The later lectures will cover variable frequency behavior The series ends with how circuits behave and are modeled at high frequencies Our goal with this text is two fold 1 To provide a more specific lecture style approach for formal course documentation Although large encyclopedic texts are useful as references one will not be required for this course 2 To dramatically reduce the cost for students and increase the flexibility of future editions by unconventionally self publishing The textbook industry has become too expensive for students to afford new books year after year and we feel that students should not have to bear the financial burden in addition to continually rising tuition costs The low cost will hopefully encourage students to keep this packet as a reference as they professionally progress rather than sell it back for cash to buy next semester s books Funds collected from sales directly help support further development of this packet and the course for future generations We appreciate your help
