Pressure Transient Analysis and Production Analysis for New Albany Shale Gas Wells Bo Song, 2010 Shale gas has become increasingly important to United States energy supply During recent decades the mechanisms of shale gas storage and transport were gradually recognized Gas desorption was also realized and quantitatively described Models and approaches special for estimating rate decline and recovery of shale gas wells were developed As the strategy of the horizontal well with multiple transverse fractures MTFHW was discovered and its significance to economic shale gas production was understood rate decline and pressure transient analysis models for this type of well were developed to reveal the well behavior In this thesis we considered a 0 Triple porosity Dual permeability0 model and performed sensitivity studies to understand long term pressure drawdown behavior of MTFHWs A key observation from this study is that the early linear flow regime before interfracture interference gives a relationship between summed fracture half length and permeability from which we can estimate either when the other is known We studied the impact of gas desorption on the time when the pressure perturbation caused by production from adjacent transference fractures fracture interference time and programmed an empirical method to calculate a time shift that can be used to qualify the gas desorption impact on long term production behavior We focused on the field case Well A in New Albany Shale We estimated the EUR for 33 wells including Well A using an existing analysis approach We applied a unified BU RNP method to process the one year production pressure transient data and performed PTA to the resulting virtual constant rate pressure drawdown Production analysis was performed meanwhile Diagnosis plots for PTA and RNP analysis revealed that only the early linear flow regime was visible in the data and permeability was estimated both from a model match and from the relationship between fracture half length and permeability Considering gas desorption the fracture interference will occur only after several centuries Based on this result we recommend a well design strategy to increase the gas recovery factor by decreasing the facture spacing The higher EUR of Well A compared to the vertical wells encourages drilling more MTFHWs in New Albany Shale

Pressure Transient Analysis Djebbar Tiab, 2024-09-04 Pressure Transient Analysis Pressure Derivative provides focuses on applications of pressure and derivative data for interpretation of pressure transient tests offering alternatives to costly commercial software Building from basics this practical text spans wells near single and multi boundary systems hydraulically fractured wells naturally fractured reservoirs interpretation of interference and pulse tests gas well test analysis including sources of emissions and decarbonizing strategies geological sequestration CCS risks and stress on CCS multiphase flow injectivity and falloff tests rate transient and multi rate tests partially penetrated perforated vertical and slanted wells and horizontal wells in conventional and unconventional reservoirs Many techniques and equations presented in this book can be found in the black box of commercial well test analysis software packages this practical text unlocks unpacks and makes critical analytical tools accessible to core users Delivers an alternative technique to type curve matching

Improving Long-term Production Data Analysis Using Analogs to Pressure Transient Analysis Techniques Damola Sulaiman Okunola,2010 In practice today pressure transient analysis PTA and production data analysis PDA are done separately and differently by different interpreters in different companies using different analysis techniques different interpreter dependent inputs on pressure and production rate data from the same well with different software packages This has led to different analyses outputs and characterizations of the same reservoir To avoid inconsistent results from different interpretations this study presents a new way to integrate PTA and PDA on a single diagnostic plot to account for and see the early time and mid time responses from the transient tests and late time boundary affected PSS responses achievable with production analysis on the same plot thereby unifying short and long term analyses and improving the reservoir characterization The rate normalized pressure RNP technique was combined with conventional pressure buildup PTA technique Data processing algorithms were formulated to improve plot presentation and a stepwise analysis procedure is presented to apply the new technique The new technique is simple to use and the same conventional interpretation techniques as PTA apply We have applied the technique to a simulated well case and two field cases Finally this new technique represents improvements over previous PDA methods and can help give a long term dynamic description of the well s drainage area
