Processor Architecture From Dataflow To Superscalar And Beyond:

Processor Architecture Jurij Silc, Borut Robic, Theo Ungerer, 2012-12-06 Today's microprocessors are the powerful descendants of the von Neumann computer dating back to a memo of Burks Goldstine and von Neumann of 1946. The so-called von Neumann architecture is characterized by a sequential control flow resulting in a sequential instruction stream. A program counter addresses the next instruction if the preceding instruction is not a control instruction such as e.g. jump, branch, subprogram call, or return. An instruction is coded in an instruction format of fixed or variable length where the opcode is followed by one or more operands that can be data addresses of data or the address of an instruction in the case of a control instruction. The opcode defines the types of operands. Code and data are stored in a common storage that is linearly addressed in units of memory words (bytes, words, etc.). The overwhelming design criterion of the von Neumann computer was the minimization of hardware and especially of storage. The most simple implementation of a von Neumann computer is characterized by a microarchitecture that defines a closely coupled control and arithmetic logic unit (ALU), a storage unit, and an I/O unit, all connected by a single connection unit. The instruction fetch by the control unit alternates with operand fetches and result stores for the ALU.

Processor Architecture Jurij Silc, Borut Robic, Theo Ungerer, 1999-06-08 A survey of architectural mechanisms and implementation techniques for exploiting fine and coarse grained parallelism within microprocessors. Beginning with a review of past techniques, the monograph provides a comprehensive account of state-of-the-art techniques used in microprocessors, covering both the concepts involved and implementations in sample processors. The whole is rounded off with a thorough review of the research techniques that will lead to future microprocessors. XXXXXXXX
Neuer Text: This monograph surveys architectural mechanisms and implementation techniques for exploiting fine grained and coarse grained parallelism within microprocessors. It presents a comprehensive account of state-of-the-art techniques used in microprocessors that covers both the concepts involved and possible implementations. The authors also provide application oriented methods and a thorough review of the research techniques that will lead to the development of future processors.

Parallel and Distributed Processing and Applications Minyi Guo, 2003 This book constitutes the refereed proceedings of the International Symposium on Parallel and Distributed Processing and Applications (ISPA 2003) held in Aizu, Japan, in July 2003. The 30 revised full papers and 9 revised short papers presented together with abstracts of 4 keynotes were carefully reviewed and selected from numerous submissions. The papers are organized in topical sections on: applications on Web based and intranet systems; compiler and optimization techniques; network routing; performance evaluation of parallel systems; wireless communication and mobile computing; parallel topology; data mining and evolutionary computing; image processing and modeling; network security and database and multimedia systems.
