Abstract—Railway system is a typical large-scale complex system with interconnected sub-systems which contain numerous components. System reliability is retained through appropriate maintenance measures and cost-effective asset management requires accurate estimation of reliability at the lowest level. However, real-life reliability data at component level of a railway system is not always available in practice, let alone complete. The component lifetime distributions from the manufacturers are often obscured and complicated by the actual usage and working environments. Reliability analysis thus calls for a suitable methodology to estimate a component lifetime under the conditions of a lack of failure data and unknown and/or mixture lifetime distributions. This paper proposes a nonparametric Bayesian approach with a Dirichlet Process Mixture Model (DPMM) to facilitate reliability analysis in a railway system. Simulation results will be given to illustrate the effectiveness of the proposed approach in lifetime estimation.

I. INTRODUCTION

Rail system requires high asset investment and yields low return over the long asset life cycle. It is a complex system with physically interconnected and functionally interdependent sub-systems and components, such as tracks, rolling stocks, power supply and signaling. The overall reliability is imperative to the quality of service provision and it is upheld through appropriate maintenance works. Maintenance scheduling is a delicate balancing act between cost and reliability. The desired level of reliability is the driver while the cost is the constraint. The system reliability inevitably relates to that of the sub-systems and components through the system configuration and function criticality.

In order to evaluate system reliability, it is essential to understand the reliability at the lowest levels. However, not every sub-system or component comes with adequate reliability data when its condition changes, usually deteriorates, due to usage, tear-and-wear, fatigue and working conditions. Failure data is not particularly well recorded, and in most cases, it is simply not available as rail systems tend to be over-maintained to eliminate failures at all. Failure behavior of the components is not necessarily constant or homogeneous. It may change over time because of possible maintenance regimes, service intensity, operation conditions, locations and climate, and vary over different components. These factors attribute to an unknown component lifetime distribution or a mixture of distributions, which complicates the estimation of component lifetime and thus fails to inform the necessary maintenance planning. To address the uncertainties on

component lifetime estimation, nonparametric statistical approaches are conceived to be a useful tool to extract lifetime information from limited available data [1].

Reliability analysis is always related to statistical approaches as the commonly adopted lifetime models are usually expressed in probability density functions [1]. Applications in railway systems have not been very extensive but successful examples can be found from component to system levels [2–4]. In order to estimate the component lifetime at a particular time period with limited real-life data and uncertain lifetime distribution, a nonparametric Bayesian approach at sub-system or component level is proposed here. Bayesian models have been employed in various railway system reliability studies [5–7], particularly in response to the uncertainty in the condition deterioration of the system or component through its life-cycle.

With Bayesian models, statistical inference can be built up from little knowledge on the component failure data and distributions, and it evolves by incorporating additional data whenever it is made available. Bayesian methods are broadly classified into parametric and nonparametric approaches. The former has the advantage of simple representation, in the sense that model parameters are able to explain the behavior of the entire data. However, the resulting model strongly depends on stringent model assumptions and imposes certain structural restrictions. The latter is quite commonly adopted in practice when the model assumptions do not always hold or the available data does not contain sufficient information.

As the component lifetime distribution in railway may be a composition of a number of unknown distributions, a mixture distribution, instead of a typical one such as Weibull and Lognormal, is a more realistic model. A Bayesian nonparametric method, based on Dirichlet Process Mixture Model (DPMM) using Markov Chain Monte Carlo (MCMC) algorithm, is proposed here. DPMM allows an empirical mixture distribution to fit the available failure data. The number and characteristics of the mixtures may be unknown but they can be captured through gradual feeding of available data [8–11]. In addition, different kernel distributions of the model are possible and the comparison of the estimation capability will be discussed through simulation. The main objective of this study is to find out the effectiveness of nonparametric Bayesian methods in the estimation of the component reliability and the necessary conditions of the available data to achieve such effectiveness.

The remainder of this paper is structured as follows. In Section II, the nonparametric Bayesian methods and Dirichlet
