Cheng, Ching-shyang Chen, Andreas Karageorghis, 2025-03-11 Over the past two decades the method of fundamental solutions MFS has attracted great attention and has been used extensively for the solution of scientific and engineering problems The MFS is a boundary meshless collocation method which has evolved from the boundary element method In it the approximate solution is expressed as a linear combination of fundamental solutions of the operator in the governing partial differential equation One of the main attractions of the MFS is the simplicity with which it can be applied to the solution of boundary value problems in complex geometries in two and three dimensions The method is also known by many different names in the literature such as the charge simulation method the de singularization method the virtual boundary element method etc Despite its effectiveness the original version of the MFS is confined to solving boundary value problems governed by homogeneous partial differential equations To address this limitation we introduce various types of particular solutions to extend the method to solving general inhomogeneous boundary value problems employing the method of particular solutions This book consists of two parts Part I aims to provide theoretical support for beginners In the spirit of reproducible research and to facilitate the understanding of the method and its implementation several MATLAB codes have been included in Part II This book is highly recommended for use by post graduate researchers and graduate students in scientific computing and engineering *On the Solution of Numerical Functional Equations; Illustrated by an Account of a Popular Puzzle and of Its Solution* Eric Harold Neville, 2025-05-22 *On the Solution of Numerical Functional Equations* by Eric Harold Neville explores the methods for solving numerical functional equations using a popular puzzle as a central example This work offers a detailed account of the puzzle's solution illustrating key mathematical principles and techniques applicable to a broader range of problems Neville's exposition provides valuable insights for students and researchers interested in numerical analysis and problem solving strategies This work has been selected by scholars as being culturally important and is part of the knowledge base of civilization as we know it This work was reproduced from the original artifact and remains as true to the original work as possible Therefore you will see the original copyright references library stamps as most of these works have been housed in our most important libraries around the world and other notations in the work This work is in the public

An Efficient, Accurate Numerical Method for the Solution of a Poisson Equation on a Sphere Samuel Y. K. Yee,1977 The need for efficient and accurate methods for the solution of boundary value problems such as Poisson type equations is well established In numerical weather prediction where solutions to such equations are required in daily routine operations it is paramount that the solution procedure be efficient An efficient shooting method to meet such a need has been reported The algebraic system resulting from the regular discretization of the Poisson equation on a sphere is however numerically unstable Thus the direct application of this method is accurate only for relatively small systems This limitation has now been successfully removed by two major improvements to the method The inherent instability of the system due to a spectral radius larger than unity is alleviated by the use of a multiple shooting technique while the instability due to the convergence of meridians on a sphere is overcome by a specially designed flexible grid Numerical examples are provided to demonstrate the effectiveness of the improved method *Numerical Analysis and Data Analysis in Support of Scientific Research* Richard W. Doherty,Joseph F. Russell,Rose M. Ring,Neil Grossbard,BOSTON COLL CHESTNUT HILL MASS SPACE DATA ANALYSIS LAB.,1969 The report describes the data analysis numerical analysis and programming performed in the solution of varied scientific problems during this year These problems range in complexity from the numerical approximation of complicated double and triple integrals and numerical solutions for systems of non homogeneous integral equations using integral approximations to the classical solution of a system of non homogeneous equations and the root solutions of cubic equations with varying coefficients Each problem encountered is presented in capsule form and its solution is outlined
