Abstract: Integrated watershed management (IWM) is becoming increasingly important in such a country where the economy depends predominately on agriculture, but there are also fast-growing urban populations that depend on water and food supplies on an unprecedented scale and attention is shifting to overall socio-economic benefit along with better water and soil conservation. The ever-increasing pressure on the natural resources is further increased the intensity by the even faster economic growth the country has witnessed in the past decades. Unprecedented economic activities in areas such as agriculture, industry, power, and communication, are affecting land-use patterns in many ways. The aim of this paper is to emphasize the importance of the effective IWM, to point out the relations between its components and to realize on beneficiaries in any watershed. In particular, social, economic, environmental, and resource systems are all considered in order to improve the applicability of IWM approach.

This paper presents that watershed management integrates various aspects of forestry, agriculture, ecology, soils, water use and other sciences to provide guidelines for the choosing appropriate IWM alternatives within the social and economic context. Addressing social and economic aspects is an essential part of evaluating the effects of IWM.

Keywords: IWM, social, economic, environmental

INTRODUCTION

IWM is becoming increasingly important concept in all over the world and attention is shifting to overall socio-economic welfare along with better water and soil conservation. Global population is continuing to grow rapidly. The ever-increasing pressure on the natural resources is further increased the intensity by the even faster economic growth, the country has witnessed in the past decades. Unprecedented economic activity in areas such as agriculture, industry, power, and communication, is affecting land-use patterns in many ways.

Major increasingly challenging problems of socio-economic development in watersheds, e.g. scarcity of natural resources and environmental deterioration, have arisen. IWM is a useful tool for dealing with these issues and maintaining sustainable development at the watershed scale. According to Bouwer (2000), IWM is such a holistic approach which requires not only supply management, but also demand management (water conservation, transfer of water to uses with higher economic returns, etc.), water quality management, recycling and reuse of water, economics, public involvement, public health, environmental and ecological aspects, socio-cultural aspects, water storage (including long-term storage), conjunctive use of surface water and groundwater, water pollution control, flexibility, regional approaches, weather modification, sustainability, etc.

The New Generation of Watershed Management Programmes and Projects, 2006-01-01 On the occasion of the International Year of Mountains 2002 FAO and its partners undertook a large scale assessment and global review of the current status and future trends of integrated and participatory watershed management The overall objectives were to promote the exchange and dissemination of experiences in implementing watershed management projects in the decade from 1990 to 2000 and to identify the vision for a new generation of watershed management programmes and projects This resource book represents a summary and critical analysis of the rich discussions and vast materials that emerged during the review as well as the review s findings and recommendations It presents the state of the art in watershed management promotes further reflection and creative thinking and proposes new ideas and approaches for future watershed management programmes and projects This publication has been written primarily for field level watershed management practitioners and local decision makers involved in watershed management at the district or municipality level It will also be a useful source of information for other readers such as senior officers and consultants specialized in other areas evaluators policy makers and students of watershed management

Integrated Watershed Management Quincy Garey, 2020-10 Traditionally watersheds have been viewed as hydrological units to conserve soil and water and a compartmental approach has been adopted However through the integrated watershed management approach all natural resources in the watershed are managed efficiently and effectively so that the rural livelihoods can be improved substantially through the convergence of various activities This book is intended to cover technologies information and knowledge that would help to address critical physical biological and socioeconomic problems of natural resources and provides a mechanism for their sustainable management and utilization Both internal and external factors of the physical environment policy economic socio cultural and technological dimensions are also elaborated This book provides readers with an opportunity to learn a flexible integrated framework for watershed management that addresses the biophysical social and economic issues affecting water resources and their use Thus this book is intended to assess watershed characteristics that will help to explore the possibilities of reducing sedimentation and its related effects

distributions of the concentrations were calculated from repeated realisations and the number of times when a user defined concentration magnitude was exceeded is quantified as a risk The results of the applications of the method are presented in the form of tables graphs and spatial maps Varying the model grid sizes indicates no significant effects on the simulated groundwater head The simulated frequency of daily occurrence of pollution incidents is also independent of the model dimensions However the simulated total contaminant mass generated within the aquifer and the associated volumetric numerical error appear to increase with the increasing grid sizes
