Three-Dimensional Machine Vision Takeo Kanade, 1987-03-31 A robot must perceive the three dimensional world if it is to be effective there Yet recovering 3 D information from projected images is difficult and still remains the subject of basic research Alternatively one can use a sensor that can provide three dimensional range information directly The technique of projecting light stripes started to be used in industrial object recognition systems as early as the 1970s and time of flight laser scanning range finders became available for outdoor mobile robot navigation in the mid eighties Once range data are obtained a vision system must still describe the scene in terms of 3 D primitives such as edges surfaces and volumes and recognize objects of interest Today the art of sensing extracting features and recognizing objects by means of three dimensional range data is one of the most exciting research areas in computer vision

Three Dimensional Machine Vision is a collection of papers dealing with three dimensional range data
