Markus Hupfer and members of the team!

September 7, 2024

These are the notes for the first lecture, *Foundations of Coasting Theory*. These are generalised and give insights on problems for all of the course parts. Some are generalised, while some are specific to the course, the latter contribution to Coasting Theory and the needs of students and their professionals at the University of Waterloo. I also used several other sources for additional materials such as Part II course book at Cambridge on Coasting Theory and Transportation given by Professor John White, and the other course notes from a Cambridge book on Subaqueous Transportation course given by Professor Tim Gattuso. I also included some more recent literature such as Applied Maths for the Flow Mechanisms. The last sentence of the notes is based on John White's course notes, "Coastal Flow Control".

All credits go to those who are not my fault.

Institute of Library Research,University of California, Berkeley,1972      **Introduction To Algebraic Coding Theory** Tzuong-tsieng Moh,2022-02-18 We live in the age of technology where messages are transmitted in sequences of 0 s and 1 s through space It is possible to make an error with noisy channels so self correcting codes become vital to eradicate all errors as the number of errors is small These self correcting codes are widely used in the industry for a variety of applications

including e-mail, telephone, remote sensing, e.g. photographs of Mars amongst others. We will present some essentials of the theory in this book. Using linear algebra we have the salient Hamming codes. The next level of coding theory is through the usage of ring theory, especially polynomials, rational functions and power series to produce BCH codes, Reed-Solomon codes and the classical Goppa codes. Then we progress to the geometric Goppa code using Algebraic Geometry.

**Introduction to Coding Theory and Algebraic Geometry** J. van Lint, G. van der Geer, 2012-12-06. These notes are based on lectures given in the seminar on Coding Theory and Algebraic Geometry held at Schloss Mickeln, Diisseldorf, November 16-21, 1987. In 1982 Tsfasman, Vladut and Zink, using algebraic geometry and ideas of Goppa, constructed a sequence of codes that exceed the Gilbert-Varshamov bound. The result was considered sensational. Furthermore, it was surprising to see these unrelated areas of mathematics collaborating. The aim of this course is to give an introduction to coding theory and to sketch the ideas of algebraic geometry that led to the new result. Finally, a number of applications of these methods of algebraic geometry to coding theory are given. Since this is a new area, there are presently no references where one can find a more extensive treatment of all the material. However, both for algebraic geometry and for coding theory, excellent textbooks are available. The combination of the two subjects can only be found in a number of survey papers. A book by C. Moreno with a complete treatment of this area is in preparation. We hope that these notes will stimulate further research and collaboration of algebraic geometers and coding theorists.

G. van der Geer, J. H. van Lint, *Introduction to Coding Theory and Algebraic Geometry*, Part I: Coding Theory, Jacobus Hendricus van Lint, 1975. In this chapter we collect, without proof, the facts from the theory of finite fields that we shall need in this course.

**Computers, Control & Information Theory**, 1983. *Graph Theory, Coding Theory, and Block Designs*, Peter Jephson Cameron, Jacobus Hendricus van Lint, 1975. These are notes deriving from lecture courses given by the authors in 1973 at Westfield College, London. The lectures described the connection between the theory of  $t$ -designs on the one hand and graph theory on the other. A feature of this book is the discussion of the recent construction of  $t$ -designs from codes. Topics from a wide range of finite combinatorics are covered, and the book will interest all scholars of combinatorial theory.

[Different Aspects of Coding Theory](#), Robert Calderbank, 1995. The symposia in applied mathematics have been held under the auspices of the American Mathematical Society and others since 1967. This book connects coding theory with actual applications in consumer electronics and with other areas of mathematics. It covers in detail the mathematical foundations of digital data storage and makes connections to symbolic dynamics, linear systems and finite automata. It also explores the use of algebraic geometry within coding theory and examines links with finite geometry, statistics and theoretical computer science.

**Coding Theory**, San Ling, Chaoping Xing, 2004-02-12. Coding theory is concerned with successfully transmitting data through a noisy channel and correcting errors in corrupted messages. It is of central importance for many applications in computer science or engineering. This book gives a comprehensive introduction to coding theory whilst only assuming basic linear algebra. It contains a detailed and rigorous introduction to the theory of

block codes and moves on to more advanced topics like BCH codes Goppa codes and Sudan's algorithm for list decoding The issues of bounds and decoding essential to the design of good codes features prominently The authors of this book have for several years successfully taught a course on coding theory to students at the National University of Singapore This book is based on their experiences and provides a thoroughly modern introduction to the subject There are numerous examples and exercises some of which introduce students to novel or more advanced material
