Enterprise Blockchain
Rajeev Hathi, Navveen Balani, 2017-11-19

Before we start with a formal introduction to blockchain let us take you for a moment to a possible future that should realize sooner than we expect

You are on a vacation outside your home country at a shopping mall and receive a notification saying there is a sale on luxurious watches

You haven't been to this store before

You pick up a watch and you wonder if the watch is genuine and worth the price

You start a mobile application and place it on the watch

The application recognizes the watch and displays the complete lifecycle of the watch like where it was manufactured and the GPS coordinates where it was designed

what is the warranty period

how much custom duty you need to pay if any

if you bring this watch back to your home country and even showing and comparing similar watches

You purchase the watch based on these details and now feel even more connected to the watch brand and establish a trust with the shopping store for selling genuine products

Let's consider a complex B2B process like an international trade finance which currently takes days to complete the trade process

If the entire workflow is automated self regulated and equipped with enough consensus between various parties carrying out the trade it can provide a window of opportunity for new buyers and sellers to handshake implement and execute trade seamlessly with lot of trust and confidence

In the above scenarios that we described earlier and possibly in all our future applications data would be a central point for businesses consumers and even system interaction

Now in a data driven world you need to establish trust and compliance between parties you need governance regulation and accountability through automated workflow and digital contracts rather than central authority and finally a piece of technology that can enable to realize this goal

Once these basic parameters are enabled it opens endless opportunities to move any value from services to digital assets across the network in a secure and transparent way

The technology enabler that can aid in realizing this opportunity is blockchain

We view blockchain as an enabler to provide consensus on data

The consensus can be between B2B B2C or C2C

We call blockchain an enabler as blockchain alone will not lead to realizing the opportunities we talked about earlier

The combinatorial power of blockchain smart contracts and technologies like IoT Artificial Intelligence would enable to deliver value driven intelligent applications

While we described our vision we are probably at the first generation of blockchain implementation where technologies are still evolving and use cases are being realized

Through this book we aim to provide a reference guide for building blockchain applications

The book comprises of three chapters

In Chapter 1 we will provide a neutral vision and architecture for blockchain without getting into vendor specific details

In chapter 2 and 3 we will demonstrate the working of two widely used blockchain implementations Ethereum and IBM Hyperledger Fabric respectively

To summarize as part of the book we will cover the following

- 1 A vendor neutral architecture for building any blockchain applications
- 2 A detailed introduction to Ethereum and its core components

We will set up a local instance of Ethereum and build end to end application on Ethereum blockchain using a hands on approach At the end we would cover topics around extension to Ethereum blockchain integration with the external world and the future of smart contracts 3 A detailed introduction to IBM Hyperledger Fabric and its core components We would cover the enterprise capabilities provided by Fabric 1 0 At the end we would set up a local instance of Fabric and build an end to end application on Fabric using a hands on approach
