Multifidelity Modeling in Vibration Analysis Ranjan Ganguli, 2025-03-07 Multifidelity Modeling in Vibration Analysis

teaches users how to make predictions about physical systems in a computationally inexpensive manner. The aim of this book is to introduce the concept of multifidelity modeling through structural dynamics case studies. The book focuses on vibration analysis problems to illustrate how multifidelity methods work. Two key methods, the response surface methods and the co-kriging method, are discussed to present the reader with state-of-the-art practices that are easy to implement. Also, two different physics-based mathematical models of a system, the Euler-Bernoulli beam model and the Timoshenko beam model, are used at two disparate levels of discretization. This book will help graduate students, researchers, and scientists who are interested in applying multifidelity models to uncertainty quantification, optimization, and robust and reliability-based design problems of vibration of engineering systems.

Response Surface Methodology Raymond H. Myers, Douglas C. Montgomery, 1971. The primary objective of response surface methodology is to aid the statistician and other users of statistics in applying response surface procedures to appropriate problems in many technical fields. Although methods are emphasized in the book, a certain amount of theory is presented so that a reader with sufficient background in mathematics, especially in the algebra of matrices, can obtain an exposure to the theoretical development. While response surface techniques are widely used, it seems that a need exists for an exposition which contains a considerable amount of the basic material under a single cover. At the time it is felt, this book may create a continued awareness of the basic techniques among the potential users.

How to Apply Response Surface Methodology John A. Cornell, 1990. **An Application of Response Surface Methodology to a Macroeconomic Model** James L. Donovan, AIR FORCE INST OF TECH WRIGHT-PATTERSON AFB OH SCHOOL OF ENGINEERING., 1985. The purpose of this thesis is to apply response surface methodology to a macroeconomic model to facilitate better analysis with the model. First and second degree polynomial response surface equations express endogenous variables as functions of selected exogenous variables in the Klein-Goldberger econometric model. Second degree polynomial response functions are used to derive function multipliers. The function multipliers show that the impact of changes in exogenous variables on endogenous variables depends on the levels of one or more other exogenous variables. The function multipliers are used to conduct policy analysis and assess factor importance. As an extension, first degree polynomial response functions are used in an example problem to maximize gross national product subject to constraints on unemployment, inflation, and ranges of fiscal policy variables. The example problem demonstrates the flexibility and value of developing a response surface equation for complex macroeconomic models.
