Digital Technologies and the Law of Obligations Zvonimir Slakoper, Ivan Tot, 2021-09-30

Digital Technologies and the Law of Obligations critically examines the emergence of new digital technologies and the challenges they pose to the traditional law of obligations and discusses the extent to which existing contract and tort law rules and doctrines are equipped to meet these new challenges. This book covers various contract and tort law issues raised by emerging technologies including distributed ledger technology, blockchain-based smart contracts, and artificial intelligence, as well as by the evolution of the internet into a participative web fuelled by user-generated content and by the rise of the modern-day collaborative economy facilitated by digital technologies. Chapters address these topics from the perspective of both the common law and the civil law tradition. While mostly focused on the current state of affairs and recent debates and initiatives within the European Union regulatory framework, contributors also discuss the central themes from the perspective of the national law of obligations, examining the adaptability of existing legal doctrines to contemporary challenges, addressing the occasional legislative attempts to deal with the private law aspects of these challenges, and pointing to issues where legislative interventions would be most welcomed. Case studies are drawn from the United States, Singapore, and other parts of the common law world. *Digital Technologies and the Law of Obligations* will be of interest to legal scholars and researchers in the fields of contract law, tort law, and digital law, as well as to legal practitioners and members of law reform bodies.

Smart Legal Contracts Jason Allen, Peter Hunn, 2022-04-04

Smart Legal Contracts: Computable Law in Theory and Practice is a landmark investigation into one of the most important trends at the interface of law and technology: the effort to harness emerging digital technologies to change the way that parties form and perform contracts. While developments in distributed ledger technology have brought the topic of smart contracts into the mainstream of legal attention, this volume takes a broader approach to ask how computers can be used in the contracting process. This book assesses how contractual promises are expressed in software and how code-based artefacts can be incorporated within more conventional legal structures. With incisive contributions from members of the judiciary, legal scholars, practitioners, and computer scientists, this book sets out to frame the borders of an emerging area of

law and start a more productive dialogue between the various disciplines involved in the evolution of contracts as software. It provides the first step towards a more disciplined approach to computational contracts that avoids the techno legal ambiguities of smart contracts and reveals an emerging taxonomy of approaches to encoding contracts in whole or in part. Conceived and written during a time when major legal systems began to engage with the advent of contracts in computable form and aimed at a fundamental level of enquiry, this collection will provide essential insight into future trends and will provide a point of orientation for future scholarship and innovation.

Tokenization of Private Equity Funds in Germany. Direct and Indirect Participation and Feasibility Philipp Rothe, 2023-05-24. Master's Thesis from the year 2023 in the subject Business economics Investment and Finance grade 1.0 International School Of Management Campus Frankfurt language English abstract. The aim of the master thesis is to examine whether private equity is suitable for tokenization. After analyzing different characteristics of private equity such as the illiquidity or mechanisms like capital calls, the master thesis concluded that the asset class is suitable. Private equity shares in the form of security tokens can help to reduce illiquidity and cashflows like the capital calls can be automated by the use of smart contracts. For the tokenization, the master thesis recommends to use existing standards such as the Ethereum blockchain or the ERC 1400 token. Furthermore, different structures for issuing private equity tokens were elaborated. These include a structure for an indirect participation via a special purpose vehicle which issues tokens and simultaneously invests into a fund but also a direct participation where the fund itself can issue tokens. During the description of possible structures, all relevant laws were included. These include the German Electronic Securities Act eWpG, German Banking Act KWG, Security Prospectus Act WpPG, Capital Investment Act VermAnlG, Securities Trading Act WpHG and the German Investment Code KAGB. All structures were evaluated from the perspective of private equity funds, institutional investors, private investors or other relevant intermediaries. Also, benefits and challenges for the different structures and participants were discussed. The benefits include an increase in efficiency of several processes, potential cost savings, the possibility for funds to reach more investors or the possibility for investors to diversify their portfolio. Still, these benefits could only be made use of if major challenges are mastered by the market participants.

These include an insufficient legal framework different hurdles when implementing a secondary market or the problem that theoretical approaches might work differently in reality
