Essays in Panel Data Econometrics Marc Nerlove, 2005-11-10 This volume collects seven of Marc Nerlove's previously published classic essays on panel data econometrics written over the past thirty five years together with a cogent essay on the history of the subject which began with George Biddell Airey's monograph published in 1861 Since Professor Nerlove's 1966 *Econometrica* paper with Pietro Balestra panel data and methods of econometric analysis appropriate to such data have become increasingly important in the discipline The principal factors in the research environment affecting the future course of panel data econometrics are the phenomenal growth in the computational power available to the individual researcher at his or her desktop and the ready availability of data sets both large and small via the Internet The best way to formulate statistical models for inference is motivated and shaped by substantive problems and understanding of the processes generating the data at hand to resolve them The essays illustrate both the role of the substantive context in shaping appropriate methods of inference and the increasing importance of computer intensive methods

Panel Methods for Finance Marno Verbeek, 2021-10-25 Financial data are typically characterised by a time series and cross sectional dimension Accordingly econometric modelling in finance requires appropriate attention to these two or occasionally more than two dimensions of the data Panel data techniques are developed to do exactly this This book provides an overview of commonly applied panel methods for financial applications including popular techniques such as Fama MacBeth estimation one way two way and interactive fixed effects clustered standard errors instrumental variables and difference in differences

Econometric Analysis of Cross Section and Panel Data Jeffrey M. Wooldridge, 2002 A comprehensive state of the art text on microeconomic methods The Journal of Economic Perspectives, 2006 This journal attempts to fill a gap between the general interest press and other academic economics journals Its articles relate to active lines of economics research economic analysis of public policy issues state of the art economic thinking and directions for future research It also aims to provide material for classroom use and to address issues relating to the economics profession Measurement Error and Latent Variables in Econometrics T. Wansbeek, E. Meijer, 2000-12-08 The book first discusses in depth various aspects of the well known inconsistency that arises when explanatory variables in a linear regression model are measured with error Despite this inconsistency the region where the true regression coefficients lies can sometimes be characterized in a useful way especially when bounds are known on the measurement error variance but also when such information is absent Wage discrimination with imperfect productivity measurement is discussed as an important special case Next it is shown that the inconsistency is not accidental but fundamental Due to an identification problem no consistent estimators may exist at all Additional information is desirable This information can be of various types One type is exact prior knowledge about functions of the parameters This leads to the CALS estimator Another major type is in the form of instrumental variables Many aspects of this are discussed including heteroskedasticity combination of data from different sources construction of instruments from the available data and the LIML estimator which is especially relevant when the instruments are weak The scope is then widened to an embedding of the regression equation with measurement error in a multiple equations setting leading to the exploratory factor analysis EFA model This marks the step from measurement error to latent variables Estimation of the EFA model leads to an eigenvalue problem A variety of models is reviewed that involve eigenvalue problems as their common characteristic EFA is extended to confirmatory factor analysis CFA by including restrictions on the parameters of the factor analysis model and next by relating the factors to background variables These models are all structural equation models SEMs a very general and important class of models with the LISREL model as its best known representation encompassing almost all linear equation systems with latent variables Estimation of SEMs can be viewed as an application of the generalized method of moments GMM GMM in general and for SEM in particular is discussed at great length including the generality of GMM

optimal weighting conditional moments continuous updating simulation estimation the link with the method of maximum likelihood and in particular testing and model evaluation for GMM The discussion concludes with nonlinear models The emphasis is on polynomial models and models that are nonlinear due to a filter on the dependent variables like discrete choice models or models with ordered categorical variables

Econometrics of Panel Data Erik Biørn, 2016-10-13 Panel data is a data type increasingly used in research in economics social sciences and medicine Its primary characteristic is that the data variation goes jointly over space across individuals firms countries etc and time over years months etc Panel data allow examination of problems that cannot be handled by cross section data or time series data Panel data analysis is a core field in modern econometrics and multivariate statistics and studies based on such data occupy a growing part of the field in many other disciplines The book is intended as a text for master and advanced undergraduate courses It may also be useful for PhD students writing theses in empirical and applied economics and readers conducting empirical work on their own The book attempts to take the reader gradually from simple models and methods in scalar simple vector notation to more complex models in matrix notation A distinctive feature is that more attention is given to unbalanced panel data the measurement error problem random coefficient approaches the interface between panel data and aggregation and the interface between unbalanced panels and truncated and censored data sets The 12 chapters are intended to be largely self contained although there is also natural progression Most of the chapters contain commented examples based on genuine data mainly taken from panel data applications to economics Although the book inter alia through its use of examples is aimed primarily at students of economics and econometrics it may also be useful for readers in social sciences psychology and medicine provided they have a sufficient background in statistics notably basic regression analysis and elementary linear algebra
