on eight different domains each of which covers a different field of competence. These many domains include Security and Risk Management. This area focuses on the fundamentals of information security including governance, risk management, compliance, and ethics. Asset Security: Asset security refers to the safeguarding of information assets and encompasses the data categorization, ownership, and management of information assets. Security Engineering: Security engineering is the process of designing and building secure systems including cryptography and other forms of secure communication. It also includes the design and architecture of such secure systems. Communication and Network Security: This category covers topics such as network design, transmission mechanisms, and the secure transfer of data across networks. IAM stands for Identity and Access Management and it refers to the process of managing user access and ensuring that the appropriate people have access to the appropriate resources. Candidates will get an understanding of the many instruments and techniques that may be used to assess the level of security present in a system within this sector. This area of responsibility encompasses the day-to-day responsibilities and best practices that are necessary to ensure the safety of an organization's information systems and data. Integration of security best practices into the software development lifecycle is the primary emphasis of software development security.
