

Muscle cells provide a good example of how cells in the human body perform the process of cell respiration, under both aerobic and anaerobic conditions. All cells, including muscle cells, need glucose and oxygen in order for their mitochondria to perform aerobic cell respiration. When the oxygen supply to cells is reduced, anaerobic respiration takes over. Ultimately, both processes provide cells with their needed ATP, which in turn supplies the cell with energy to function properly.

When muscle activity is continuous and excessive, muscle cells will switch from aerobic respiration to anaerobic respiration as the availability of oxygen decreases. Overworked muscle cells in a state of anaerobic respiration can become tired or fatigued. A fatigued muscle cannot function efficiently. The symptoms of excessive anaerobic respiration are sore muscles and muscle "cramps". These cramps are largely due to a buildup of lactic acid among the muscle tissue. Fortunately, this condition is not permanent. When the overworked muscle cells are given a rest to allow the body to "catch up" its oxygen supply, the lactic acid will recycle back through the system and the cells will revert once again to aerobic respiration.

PURPOSE OF INVESTIGATION:

1. To experience the reduction in muscle efficiency from continuous muscle contractions due to muscle fatigue.
2. To explain the observed pattern of muscle fatigue in terms of aerobic and anaerobic respiration pathways, oxygen availability, and waste buildup.
