Science Internet New Technologies grade 2 00 Management Center Innsbruck Management Center Innsbruck language English abstract The cloud paradigm introduces a change in visualization of system and data owned by an enterprise Further the on service based sharing of resources such as storage hardware and applications which are delivered with cloud computing in a total different way has facilitated coherence of the resources and economies of scale through its pay per use business model It is no longer a collection of devices on a physical location and run a particular software program with all the needed data and resources present at a physical location but instead is a system which is geographically distributed with consideration on both application and data But even when the development of distributed cloud architectures and services are all dealing with the same issues of scalability elasticity over demand broad network access usage measurement security aspects such as authorization and authentication and many other concepts related to multitenant services in order to serve a high number of concurrent users over the internet is it the main goal for companies to find the right solution for their requirements The right solution can be a public a private or a hybrid cloud and although the issues are very similar in any of these solutions it depends further on the degree of potency of one or some issues which are related to different kind of industries and organisations to evaluate the right cloud based approach for a particular company This means we have to agree that the evolution of a new paradigm requires adaptation in usage patterns and associated functional areas to fully benefit from the paradigm shift *Cloud Computing. Pal, Priyanka Ora, 2019-11-18 Doctoral Thesis Dissertation from the year 2019 in the subject Computer Science Internet New Technologies language English abstract Continuous advancement in software field and widespread use of software products many innovative applications have emerged cloud computing is one of them In cloud computing users need not to install software they just log in the cloud and pay for their required service As many users are frequently using cloud computing a big question arises here is the security of user's personal data present at cloud Therefore we need to safeguard the data in the midst of untrusted processes On keeping these issues in mind a security model is designed in this thesis The whole model is divided into three sections one is data encryption second is secure data storage and the third one is maintenance of data integrity In first section before uploading the file on cloud file is encrypted by RSA Partial Homomorphic algorithm Two keys public and private are generated after encryption Between these two keys public key is known to all but private key is known to only authorize users In second section the data owner uploads the encrypted file moreover with this one access permission list containing names of authorized user and their respective permission In this model two access permissions Read Only and Read and Write are defined by the data owner In third section the cloud provider calculates hash value of uploaded file using MD5 hash algorithm This hash value is transferred back to the data owner to use it for verification purpose As Owner performs verification hash value of the desired data present at cloud is again calculated Now this new hash value matches with old hash value which is present at owner end If it matches no modification is performed if hash value does not match then some modifications has been performed on the uploaded data After uploading the file on cloud this file is visible to all users They can easily download the file but cannot decrypt it as all users don't have private key Private key is sent to authenticate users by e mail so that they can get original data Data modification is controlled by the owner as cloud stores data in encrypted form The whole architecture is compared with combination of Triple DES and SHA The results generated by proposed model have shown that it takes less encryption and decryption time as compare to 3DES and SHA combination Therefore the proposed model provides better security and maintains data integrity of the uploaded data on cloud
