Artificial Neural Nets and Genetic Algorithms David W. Pearson, Nigel C. Steele, Rudolf F. Albrecht, 2012-12-06

Artificial neural networks and genetic algorithms both are areas of research which have their origins in mathematical models constructed in order to gain understanding of important natural processes

By focussing on the process models rather than the processes themselves significant new computational techniques have evolved which have found application in a large number of diverse fields

This diversity is reflected in the topics which are subjects of the contributions to this volume

There are contributions reporting successful applications of the technology to the solution of industrial commercial problems

This may well reflect the maturity of the technology notably in the sense that real users of modelling prediction techniques are prepared to accept neural networks as a valid paradigm

Theoretical issues also receive attention notably in connection with the radial basis function neural network

Contributions in the field of genetic algorithms reflect the wide range of current applications including for example portfolio selection filter design frequency assignment tuning of nonlinear PID controllers

These techniques are also used extensively for combinatorial optimisation problems
