## LOCATION

**REMOTE** - Storage, management and processing occurs on a remote central network server. The data is accessible over the internet, away from the source.

**NEAR-ACCESS** - Data is processed physically close to or on the actual device, the data source, which is located at the edge of the network.

## LATENCY

**HIGH** - Frequent and high load data exchange puts strain on the network, resulting in high latency.

**LOW** - Requires little bandwidth as information is initially processed close to the data source.

## CAPACITY

**HIGH** - Can process large volumes of data and scale accordingly; cost is also determined by processing unit used.

**LOW** - Can only process so much data due to limited availability of resources. This is somewhat compensated by near-access communication with nodes.

## DISTRIBUTION

**CENTRALIZED** - The cloud is a Centrally Managed System (CMS), which means it is controlled by a single entity.

**DECENTRALIZED** - Computations are performed at the edge of the network, often utilizing distributed nodes.

## SECURITY

**HIGH** - The virtual server is managed by one entity, which ensures maximum protection

**MEDIUM** - Distributed data means security can be more susceptible to individual threats and unaccounted outside factors.

## BENEFITS

- Cost reduction
- Scalability
- Accessibility
- Security

- High speed and responsiveness
- Low latency
