language which is especially important when you're just getting started in software development. The community support is very good so if you get stuck there's a good chance that the problem and its solution already exist on the web. Now that we've gotten a bird's-eye view of JavaScript, let's get into the more technical detail. JavaScript was created to add life to webpages. Just like HTML and CSS, JavaScript is written in plain text files with a .js extension. As previously mentioned, JavaScript can be used to accomplish many useful operations on the frontend like validating forms, alerting users, storing temporary data, and performing calculations, to name just a few. Pro tip: Apart from the name itself, JavaScript has no relation to Java. Beginners often get confused between the two languages. Remember that Java is an entirely different language made for a different purpose, although you'll still find it running on certain website backends.
