*Advances in Polymer Coated Textiles* Gueneri Akovali, 2012-07-24 Polymer coated textiles are known as engineered composite materials at macro scale Coating can offer significant improvements to the substrate mainly of the physical like impermeability and fabric abrasion and or of overall chemical properties as well as the appearance by combining advantages of the components Polymer coated systems employ various kinds of textile substrate structures available mostly of technical textiles Since there are a number of possibilities for different types of polymers and their combinations textile structures as well as their combinations are possible it is widely open to creativities and almost every day some new innovative application is being introduced Polymer coated textile industry being parallel to the developments in the textile research is so dynamic that today applications like reactive coatings with nanoparticles with self cleaning self sterilizing surfaces systems with conductive polymer coatings to provide EM shielding electronic textile systems with body monitoring properties environmental responsive systems etc are already somewhat classical and are considered almost left in the shade of incoming new developments This book is an up to date summary of the subject by considering the passage from conventional to emerging technologies Criteria for selection of the coat and textile are considered and the manufacturing basics of the system are summarized Emerging technologies and applications including smart intelligent and nanostructured applications are completed by testing and quality control methods of these systems The book is written for all that are interested in this interdisciplinary area it certainly will prove to be of great help to textile and polymer technologists to engineers to scientists as well as to students

**Resistivity of Conductive Polymer-coated Fabric**, 2003 Preparation of conductive polymer coated fabrics was carried out by admicellar polymerization with and without addition of salt By this method thin layers of conducting polymers namely polyaniline polypyrrole polythiophene and poly N methylpyrrole were formed on cotton and polyester fabrics via a surfactant template The surface morphology of the treated fabrics was examined using scanning electron microscopy SEM In addition the effects of monomer concentration oxidant monomer ratio and the amount of salt on the resistivity of the resulting fabrics were studied The results showed that the apparent surface and volume resistivities decreased with increasing in monomer concentration in the range 5 15 mM There was no significant difference in resistivity values when oxidant monomer ratios of 1 1 and 2 1 were used Addition of 0 5 M NaCl was found to decrease the resistivity of the resulting fabrics significantly SEM micrographs of the treated fabrics show distinctive film like coatings on the fiber surfaces The lowest resistivity obtained with polypyrrole was around 106 ohms
