Primack,2016-05-15 This is a book well suited for a wide range of undergraduate courses as both a primary text for conservation biology courses and a supplement for ecological and environmental science courses New coauthor Anna Sher joins longtime Sinauer author Richard Primack in creating a book that combines the readability of Primack s A Primer of Conservation Biology with the depth and coverage of his larger textbook Essentials of Conservation Biology The result is a book well suited for a wide range of undergraduate courses as both a primary text for conservation biology courses and a supplement for ecological and environmental science courses Using the chapter framework of the current Primer as a springboard the authors have added three chapters focused on population biology conservation tools Chapter 7 restoration ecology Chapter 10 and the future of conservation Chapter 12 Sustainable development ex situ conservation and other key topics have been expanded and updated with hundreds of new examples explanations citations and figures to enhance learning and excitement for the subject Dr Sher has mined her experience of having taught conservation biology using Dr Primack s texts for over a decade to fine tune the presentation of difficult concepts particularly in economics and politics Coverage of recent conservation biology events in the news such as the poaching of Cecil the Lion the first papal encyclical on the environment and the international Paris Accord on climate change keeps the content fresh and current *Ecological Explosions* Daniel Simberloff,2026-01-16 A leading biologist offers a comprehensive and accessible history of invasive species science from its earliest antecedents through its current research foci and controversies From the arrival of the naval shipworm in the Black Sea in the first millennium BC to the escape of the Burmese python in Florida in 1992 humans have moved species to new locations deliberately or inadvertently for thousands of years Agricultural

and environmental impacts of some invasions were evident early although whether observers recognized that the cause was an introduced species is uncertain. The history of invasion biology truly begins in the sixteenth through eighteenth centuries when explorers noticed European species on various distant islands and in North America. In the nineteenth century biogeographers studying species distributions across the globe introduced the first native and non-native species categorizations and prominent researchers like Charles Darwin began to describe the impacts of introduced species. In the nineteenth and twentieth centuries as humans moved increasing numbers of species across the globe the advent of modern ecology deepened our understanding of the scope of the problem. In *Ecological Explosions* invasive species expert Daniel Simberloff provides a thorough overview of the development of invasion science from early research including from the perspectives of leading scientists like Aldo Leopold to the field's future. Simberloff explores the work of pioneering ecologists like Charles Elton antecedents of what became today's invasion biology before discussing the field's true emergence in the 1980s its explosive methodological and theoretical expansion its integration with other disciplines and its increasing visibility not only within the biological literature but also in government policies across the world in the 1990s. Finally he investigates current controversies such as the debate over whether the entire science is xenophobic and asks how ecosystems might adapt to a rapidly globalizing world and ever increasing numbers of introduced species including the joro spider lionfish spotted lanternfly common reed and Asian carp.
