Envisioning the Survey Interview of the Future Frederick G. Conrad, Michael F. Schober, 2007-12-10 Praise for *Envisioning the Survey Interview of the Future* This book is an excellent introduction to some brave new technologies and their possible impacts on the way surveys might be conducted Anyone interested in the future of survey methodology should read this book Norman M Bradburn PhD National Opinion Research Center University of Chicago *Envisioning the Survey Interview of the Future* gathers some of the brightest minds in alternative methods of gathering self report data with an eye toward the future self report sample survey Conrad and Schober by assembling a group of talented survey researchers and creative inventors of new software based tools to gather information from human subjects have created a volume of importance to all interested in imagining future ways of interviewing Robert M Groves PhD Survey Research Center University of Michigan This collaboration provides extensive insight into the impact of communication technology on survey research As previously unimaginable communication technologies rapidly become commonplace survey researchers are presented with both opportunities and obstacles when collecting and interpreting data based on human response *Envisioning the Survey Interview of the Future* explores the increasing influence of emerging technologies on the data collection process and in particular self report data collection in interviews providing the key principles for using these new modes of communication With contributions written by leading researchers in the fields of survey methodology and communication technology this compilation integrates the use of modern technological developments with established social science theory The book familiarizes readers with these new modes of communication by discussing the challenges to accuracy legitimacy and confidentiality that researchers must anticipate while collecting data and it also provides tools for adopting new technologies in order to obtain high quality results with minimal error or bias *Envisioning the Survey Interview of the Future* addresses questions that researchers in survey methodology and communication technology must consider such as How and when should new communication technology be adopted in the interview process What are the principles that extend beyond particular technologies Why do respondents answer questions from a computer differently than questions from a human interviewer How can systems adapt to respondents thinking and feeling What new ethical concerns about privacy and confidentiality are raised from using new communication technologies With its multidisciplinary approach extensive discussion of existing and future technologies and practical guidelines for adopting new technology *Envisioning the Survey Interview of the Future* is an essential resource for survey methodologists questionnaire designers and communication technologists in any field that conducts survey research It also serves as an excellent supplement for courses in research methods at the upper undergraduate or graduate level

The Effect of Interviewer Image in a Virtual-World Survey
Joe Murphy, Elizabeth Dean, Sarah Cook, Michael Keating, 2010-12-16 When survey respondents are consciously or unconsciously influenced by the characteristics of the interviewer bias in the survey estimates may result The effects of

interviewer characteristics such as gender and race on survey estimates have been considered previously but isolating and experimentally manipulating a single interviewer characteristic has been infeasible. With the advent of online virtual worlds it is now possible to conduct experiments focusing on individual physical interviewer characteristics. We conducted an exploratory study surveying 60 individuals in Second Life, an online virtual world community in which the respondent and interviewer were both represented as avatars, three-dimensional representations of real-life individuals. To explore the effect of interviewer appearance on reported health behaviors and attitudes, we randomly assigned half of the survey respondents to a thin interviewer and half to a heavy interviewer. The data suggest that those who reported to the heavy interviewer were less likely to say their own avatar was attractive, reported less frequent real-life exercise, and reported a higher real-life body mass index, although because of the small number of participants we did not detect statistically significant differences. The findings suggest that interviewer appearance may have a biasing effect on reports in virtual world surveys and perhaps in real-world surveys. Despite the lack of statistically significant findings, the study illustrates the future potential benefits and challenges to surveying and conducting methodological research in a virtual world.

Understanding Social Signals: How Do We Recognize the Intentions of Others? Sebastian Loth, Jan P. De Ruiter, 2016-05-30

Powerful and economic sensors such as high-definition cameras and corresponding recognition software have become readily available, e.g., for face and motion recognition. However, designing user interfaces for robots, phones, and computers that facilitate a seamless, intuitive, and apparently effortless communication as between humans is still highly challenging. This has shifted the focus from developing ever faster and higher-resolution sensors to interpreting available sensor data for understanding social signals and recognizing users' intentions. Psychologists, ethnologists, linguists, and sociologists have investigated social behavior in human-human interaction. But their findings are rarely applied in the human-robot interaction domain. Instead, robot designers tend to rely on either proof-of-concept or machine-learning-based methods. In proving the concept, developers effectively demonstrate that users are able to adapt to robots deployed in the public space. Typically, an initial period of collecting human-robot interaction data is used for identifying frequently occurring problems. These are then addressed by adjusting the interaction policies on the basis of the collected data. However, the updated policies are strongly biased by the initial design of the robot and might not reflect natural, spontaneous user behavior. In the machine-learning approach, learning algorithms are used for finding a mapping between the sensor data space and a hypothesized or estimated set of intentions. However, this brute-force approach ignores the possibility that some signals or modalities are superfluous or even disruptive in intention recognition. Furthermore, this method is very sensitive to peculiarities of the training data. In sum, both methods cannot reliably support natural interaction as they crucially depend on an accurate model of human intention recognition. Therefore, approaches to social robotics from engineers and computer scientists urgently have to be informed by studies of intention recognition in natural human-human communication. Combining the investigation of natural human

behaviour and the design of computer and robot interfaces can significantly improve the usability of modern technology For example robots will be easier to use by a broad public if they can interpret the social signals that users spontaneously produce for conveying their intentions anyway By correctly identifying and even anticipating the user s intention the user will perceive that the system truly understands her his needs Vice versa if a robot produces socially appropriate signals it will be easier for its users to understand the robot s intentions Furthermore studying natural behaviour as a basis for controlling robots and other devices results in greater robustness responsiveness and approachability Thus we welcome submissions that a investigate how relevant social signals can be identified in human behaviour b investigate the meaning of social signals in a specific context or task c identify the minimal set of intentions for describing a context or task d demonstrate how insights from the analysis of social behaviour can improve a robot s capabilities or e demonstrate how a robot can make itself more understandable to the user by producing more human like social signals
