Research Proposal (Part B2)

**Section 2: Scientific Proposal**

## 1. State-of-the-art

### 1.1. Native South American languages

Although Spanish and Portuguese are the primary languages for almost the complete human population of South America, there are actually more than 500 languages spoken in this part of the world (Gordon & Grimes 2005, slightly lower estimates of the number of living languages can be found in Campbell 1997: 170 and Fabre 1998). Most of these languages are so-called 'native' languages predating European conquest, most probably direct descendants of the languages of the first human populations entering this continent. Although human populations only entered this part of the world relatively recently (when exactly is controversial), and notwithstanding the very early descriptive and comparative interests by linguists for these languages (the first grammars and dictionaries were published in the 16th century, and the first linguistic families were proposed in the 18th century, cf. Campbell 1997: 29 ff.), still very little is known about the linguistic phylogeny of South American languages. This project aims to unravel the linguistic events that shaped the languages of this continent.

Currently, there is broad consensus about the existence of a few major linguistic families in South America (e.g. Arawakan, Cariban, Tupian, Tucanoan, Chibchan, Quechuan, Panoan), and very many small and shallow groups of related languages, many of which have only one or two member-languages spoken today (Campbell 1997: 170 ff.). Both the details of the internal structure of the accepted groups, and the relation between the many linguistic families, both large and small, are still open questions. Partly, this lack of knowledge is caused by the relatively limited amount of research that has attempted to unravel the linguistic prehistory of South American languages, and by the fact that only relatively recently have broad descriptive efforts started to document more than just the few major native languages of this continent.

The special geographical formation of South America, which is dominated by large mountain ranges and large tropical river basins, has probably also lead to a much more intermingled linguistic situation compared to many other parts of the world. Cross-linguistically, mountain ranges often have an intermingled linguistic situation (cf. the Caucasus or New Guinea), probably caused by valley-wise spread of languages, with older reclusive groups isolated at the end of valleys. Tropical river basins have the special property that populations spread almost exclusively along the rivers, with newer populations settling in between existing groups, or passing them by completely. This leads to the strikingly non-continuous geographic distribution of related languages.

The approach taken by this project to uncover deeper and more detailed genealogical relationships between the languages in South America is to bring together as much as possible of the information available about these languages, and to develop computer-assisted methods to quantify the analysis of all this data. The basis for the quantification will be the historical-comparative method.

### 1.2. The historical-comparative method

The historical-comparative method to uncover genealogical relationships between languages is an established and highly refined approach, informed by more than two centuries of experience and application. This method is based on the detection of homologous strings of sounds between languages, called 'cognates'. Shortly summarized, the historical development of phonemes is established on the basis of a sizable set of
