controversy over the basic cognitive processes that underlie memory and modern research has shown that these characterizations reflect distinctions among qualitatively different forms of memory The third theme is Compartmentalization the notion that the different forms of memory are accomplished by distinct brain systems Recent research has revealed parallel memory systems that separately mediate our ability for conscious recollection our capacity to acquire skills and habits and our acquisition of emotional attachments and aversions The fourth theme is Consolidation the process by which memories are transformed from a labile trace into a permanent store Scientists have shown that there are two distinct stages in memory consolidation one involving cellular mechanisms that underlie a fixation of changes in the neuronal connection strengths and the other involving a reorganization and reconstruction of the circuits that store and retrieve memories The book assumes little background knowledge from biology or psychology and is intended as a text for use in undergraduate courses on memory and cognitive science and for early graduate students in neuroscience cognitive science or biology It encapsulates the major concepts in the field and makes this area of research accessible to students who pursue a variety of related disciplines
