

INTRODUCTION TO CODING THEORY

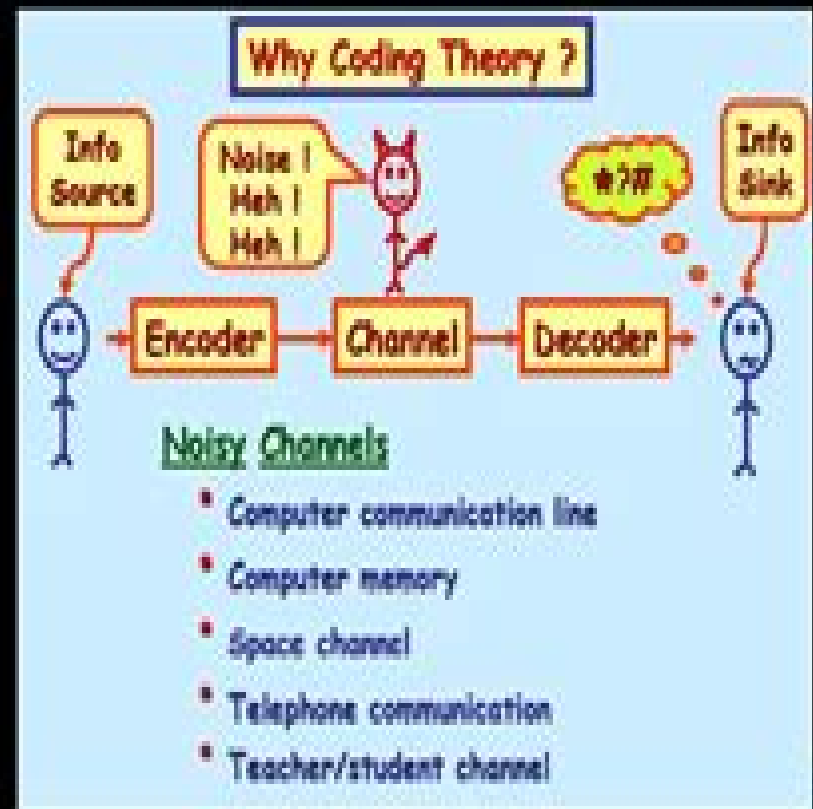

All communication involves three basic steps:

- Encoding a message at its source.
- Transmitting that message through a communication medium.
- Decoding the message at its destination.

Coding theory - theory of error correcting codes - attempts to minimize data loss due to errors introduced in transmission from noise, interference or other forces.

Binary Code: A code C that is formed only by using the numbers 0 and 1.

Examples of codes: $C_1 = \{00, 01, 10, 11\}$
 $C_2 = \{000, 010, 101, 100\}$
 $C_3 = \{00000, 01101, 10111, 11011\}$

Ooi,2012-12-06 Coding for Channels with Feedback presents both algorithms for feedback coding and performance analyses of these algorithms including analyses of perhaps the most important performance criterion computational complexity The algorithms are developed within a single framework termed the compressed error cancellation framework where data are sent via a sequence of messages the first message contains the original data each subsequent message contains a source coded description of the channel distortions introduced on the message preceding it Coding for Channels with Feedback provides an easily understood and flexible framework for deriving low complexity practical solutions to a wide variety of feedback communication problems It is shown that the compressed error cancellation framework leads to coding schemes with the lowest possible asymptotic order of growth of computations and can be applied to discrete memoryless channels finite state channels channels with memory unknown channels and multiple access channels all with complete noiseless feedback as well as to channels with partial and noisy feedback This framework leads to coding strategies that have linear complexity and are capacity achieving and illustrates the intimate connection between source coding theory and channel coding theory Coding for Channels with Feedback is an excellent reference for researchers and communication engineers in the field of information theory and can be used for advanced courses on the topic **Modulation and Coding Techniques**

Source Coding Theory Robert M. Gray, 1989-10-31 Source coding theory has as its goal the characterization of the optimal performance achievable in idealized communication systems which must code an information source for transmission over a digital communication or storage channel for transmission to a user The user must decode the information into a form that is a good approximation to the original A code is optimal within some class if it achieves the best possible fidelity given whatever constraints are imposed on the code by the available channel In theory the primary constraint imposed on a code by the channel is its rate or resolution the number of bits per second or per input symbol that it can transmit from sender to receiver In the real world complexity may be as important as rate The origins and the basic form of much of the theory date from Shannon's classical development of noiseless source coding and source coding subject to a fidelity criterion also called rate distortion theory 73-74 Shannon combined a probabilistic notion of information with limit theorems from ergodic theory and a random coding technique to describe the optimal performance of systems with a constrained rate but with unconstrained complexity and delay An alternative approach called asymptotic or high rate quantization theory based on different techniques and approximations was introduced by Bennett at approximately the same time 4 This approach constrained the delay but allowed the rate to grow large
