

WEEK 1 26/07/2018

- An Immunogen (immunogenic) elicits an adaptive immune response e.g. influenza virus
- An Antigen (Ag) is a specific immune target (usually referring to recognition by adaptive cells) e.g. hemagglutinin on surface of influenza virus.
- Levels of protection from pathogens:
 - First line: Physical barriers that viruses and bacteria must cross. Skin covers and mucous membranes that line digestive, respiratory, reproductive tracts, cover ~400 m²
 - Second line: Innate immune system. Macrophages (Greek for "big eater"), neutrophils, natural killer (NK) cells, Cytokines (hormone-like proteins that mediate inflammation), Complement proteins
 - Third line (vertebrates only): Adaptive immune system, adapts to defend against specific pathogens using variable receptors.
 - B cells make antibodies, each individual B cell makes a specific antibody to a specific antigen
 - T cells mediate cellular responses using variable receptors (T cell receptors; TCRs)

- Innate Immunity:
 - Present at birth and for life
 - No specificity (i.e. can respond to many stimuli)
 - Not modified by stimulus (i.e. no memory, not enhanced on subsequent exposure)

**Modeling and
Dynamics of Infectious Diseases** Zhen Ma, 2009 This book provides a systematic introduction to the fundamental methods
and techniques and the frontiers of OCo along with many new ideas and results on OCo infectious disease modeling
parameter estimation and transmission dynamics It provides complementary approaches from deterministic to statistical to
network modeling and it seeks viewpoints of the same issues from different angles from mathematical modeling to statistical
analysis to computer simulations and finally to concrete applications

Population Biology of Infectious Diseases R.M.
Anderson, R.M. May, 2012-12-06 for the design of control programs in extreme cases as discussed below by Fine et al this
volume and elsewhere it can happen that immunization programs although they protect vaccinated individuals actually
increase the overall incidence of a particular disease The possibility that many nonhuman animal populations may be
regulated by parasitic infections is another topic where it may be argued that conventional disciplinary boundaries have
retarded investigation While much ecological research has been devoted to exploring the extent to which competition or
predator prey interactions may regulate natural populations or set their patterns of geographical distribution few substan-
tial studies have considered the possibility that infectious diseases may serve as regulatory agents 1 8 On the other hand the
many careful epidemiological studies of the transmission and maintenance of parasitic infections in human and other animal
populations usually assume the host population density to be set by other considerations and not dynamically engaged with
the disease see for example 1 2 With all these considerations in mind the Dahlem Workshop from which this book derives
aimed to weave strands together testing theoretical analysis against empirical facts and patterns and identifying outstanding
problems in pursuit of a better understanding of the overall population biology of parasitic infections For the purpose of the
workshop the term parasite was defined widely to include viruses bacteria protozoans fungi and helminths
