

# Ladder and Functional Block Programming

by Stefan

I obtained the following information from the local Programmable Logic Controller (PLC) forum in St. Gallen, Switzerland: The first edition of the book was published in 1986, which explains why the word "concepts" is present in the title. "Technological advances in recent years have resulted in the development of the programmable logic controller (PLC) and a corresponding evolution of ladder programming." (This means the ladder program has to drive the PLC rather than I/O.)

The idea of the book is something of a mixture between an abstract model of any useful technique for programmable logic controllers and also at least the basis of providing support, making sure that users work with programmable logic controllers. It addresses the problem of different programmable control systems being used in different environments and provides some of the reasons for this, including the historical context and illustrating that not everyone has a model of "concepts".

In some ways the reader is studying the ability necessary to write programs for programmable logic controllers, using standard structures, mathematical operations and variables and the book is the first step towards an all-encompassing, generic and practical guide at the end of the book.

Now, Programmable Logic Controllers is not called as PLCs, but as, in one sense, the technology and the design is included here. The answer is simple. I personally have always been interested in something that started with a switch or some logic in the form of a ladder or function PLC's being used by engineers and not just knowledge of traditional programming languages and techniques, as opposed to "ladder programming" and "function block programming". This is an aspect for programmers to write programs
